Any self-insurance plan to be successful must be most carefully decided upon and must be based upon those sound principles of finance, law of averages and prevention of loss which form the foundation for the successful standard insurance carrier. Having established such a plan, charges for protection based upon standard rates should be collected and wisely administered. A most carefully developed plan of adequate excess and protection against catastrophe must be provided as a part of any such successful arrangement for intercompany self-insurance. More important than anything else, an agency must be provided to minimize fire and accident losses. Success is impossible unless well-organized, intensive and continuous efforts are maintained for the prevention of losses incident to the risks carried.

Insurance, insurance costs, protection, improvement of property and personnel, uninterrupted service, conservation of waste and economy in operating costs—these are of unquestioned importance and merit the attention of all of us who share the responsibility for a careful administration of our trust.

# Electrification Surveyed*

## Conditions in Europe and America studied. Recent electrification projects. No need for standardization

By Britton I. Budd
*Chairman Committee on Electrification of Steam Railroads*

*Britton I. Budd*

THE past year has seen an extension of electrification in the United States, most of the larger European countries, South America, Australia, India and Japan. Initial installations are being made in some of the smaller countries like Costa Rica, Czechoslovakia and Siam. Several of the European countries are at work on programs for electrification which will take years to complete but on which substantial progress is recorded every year.

In Great Britain electrification is still confined for the most part to suburban passenger traffic. No through service has been electrified as yet, but extensions of the suburban systems are constantly being made. In Holland considerable additional track has been electrified for passenger service only. Sweden recently completed electrification of one long line for general traffic purposes. France, Germany, Switzerland and Italy continue to extend electrification to new sections. At the end of 1927 Germany had 750 miles of road electrified and was proceeding with 185 miles more. Switzerland had 1,250 miles of standard-gage routes electrified and 150 more miles scheduled for 1928. Italy has about 750 miles of electrified routes in 1927, with 200 miles scheduled for completion in 1928 and expectation of about 1,400 miles by the end of 1930.

Lines operating into Warsaw, Poland, and Prague, Czechoslovakia, are being electrified and may be in operation by the time this report is printed. Three new standard-gage lines are projected between France and Spain across the Pyrenees. Some of the work is now under way, and it is reported that two of the lines at least will be electrified. Several of the smaller European countries are reported to be making studies of electrification.

The Indian government is working on ambitious plans for electrification of a large extent of the principal lines in that country. Two railroads are already operating by electric power in the vicinity of Bombay, the first having gone into service in 1925 and the second in 1928. Both these roads plan to keep on extending their electrified sections for several years.

In Central and South America there have been several extensions of electrification. The Mexican Railway Company has extended its electrification, the Paulista Railway of Brazil has extended also, and the Western Minas Railway has ordered its first electrical equipment. The Transandine Railways in Chile and Argentina, which are operated as a unit, are electrifying and the Chilean section has been completed. In Canada the Canadian National Railways have announced that they will build a new terminal at Montreal and use electric traction in the city.

---

*Abstract of report presented at the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

In 1927 the Chicago, Milwaukee & St. Paul Railway completed the extension of its electrification from Black River to Seattle. This extension was about 10 miles of double track and brought the total length of track electrified up to 881 miles.

The Illinois Central Railroad completed in 1927 the first full calendar year of electrical operation on its Chicago surburban service. Electrical operation began in August, 1926. The last steam schedule was for 396 trains per day. The number has been gradually increased up to 566 trains on week days in April, 1928. Express service has been added on some lines and more frequent service to most stations. The running time of the different services has been shortened by 11 to 28 per cent. The response of patronage showed about 19 per cent more rides in 1927 than in 1926.

The Virginian Railway also completed its first calendar year of electrification in 1927. The first short section of electrification was placed in operation in September, 1925, but the entire electric zone was not in service until September, 1926. Officials of the road express satisfaction with the new motive power, which has greatly facilitated their movement of heavy-tonnage trains over mountain grades.

The Pennsylvania Railroad is engaged in a large electrification project at Philadelphia. A new passenger station for through traffic is being built on the west side of the Schuylkill River. An underground station for suburban traffic is being built in the heart of the city near the old Broad Street station. All operation into the underground station will be electric, and the electric trains will connect the two new stations with each other through a four-track subway. Two suburban services to Chestnut Hill and Paoli have been electrified for several years. Two additional surburban routes are now in the process of electrification and are expected to be completed in 1928. One line extends to Chester and Wilmington, 28 miles south of Philadelphia. Electric operation on this line is scheduled to begin about the middle of the year. The other line extends westward from Philadelphia to West Chester via Media, a distance of 27 miles. This electrification is expected to be ready by early autumn.

### Cascade Tunnel Nearing Completion

The Great Northern Railway on May 1, 1928, holed through its new Cascade Tunnel. This tunnel is nearly 8 miles long, the longest in the Americas. It is within the Great Northern's electric zone and will be equipped for 11,000-volt overhead trolley like the old tunnel which it replaces. The old tunnel was originally electrified by itself in 1909 with three-phase alternating current. This was changed in 1927 to the present single-phase system in anticipation of establishing an electrified division extending about 75 miles. It is expected that the new tunnel and approaches will be ready for service in the fall of 1928.

The Philadelphia & Reading Company has been engaged for some time in drafting plans for the electrification of its Philadelphia suburban service. The Boston, Revere Beach & Lynn Railroad has announced that it will electrify. This is a high-speed, narrow-gage road carrying suburban traffic between East Boston and its terminals at Winthrop and Lynn, Mass. The Detroit, Toledo & Ironton Railroad has been operating by electricity over 18 miles of its route between Fordson and Flat Rock, Mich. Electrification is now being extended a distance of 27 miles from Flat Rock to Petersburg Junction.

During April, 1928, the Delaware, Lackawanna & Western Railroad announced plans for electrification of its New York suburban service. The electrification will follow the main line from Hoboken to Dover (via Newark and Summit) with two branches to Montclair and Gladstone. The total mileage is said to be 78 miles of route and 173 miles of track. Detailed specifications have not been announced, but it is estimated that construction will be completed in about two years. This project has an interesting and rather unusual feature in the support being given by the communities affected. Representatives of civic organizations in all these communities, with a population of about 1,250,000, presented a petition to the railroad asking for electrification and pledging co-operation in securing an advance of commutation fares to support the improvement of transportation facilities.

The Cleveland Union Terminals Company, which is constructing a new union station in Cleveland, has called for bids on electrical equipment. It is expected that it will soon announce the details of the proposed electrification.

### Systems of Electrification

Some countries have taken definite steps to standardize on a system for all future work and in certain cases have gone so far as to rebuild previous electrifications to conform with the new standard. In general it may be said that the central European and Scandinavian countries favor low-frequency alternating current at a high voltage. The standard system in these countries uses single-phase energy at 16⅔ cycles with 15,000 volts at the trolley wire. A secondary standard is used in Germany for suburban service with direct current at 800 volts.

England and the western countries of Europe are using direct current at voltages from 600 to 1,500, with third-rail for suburban lines and overhead trolley for the longer lines. The English colonies are following the lead of the home country, as also are those railroads in South America which look to England for their technical advice.

Italy has had a long experience with the use of three-phase energy at 3,300 volts and is proceeding with the general electrification of long-distance lines on this basis. It is interesting to note that experimental installations are being made with high-voltage direct current and still higher voltage for three-phase.

In a report to the Sectional World Power Conference in 1926 H. Parodi of the Paris-Orleans Railway gave his view of the adoption of standard systems in Europe. He stated that the two general choices of system have grown up around different and distinct conceptions of the relationship which will be maintained in the future between the railroad and power industries. France, England, Belgium, Holland, Japan, South America, Africa, India and Australia have followed the policy of utilizing the power stations producing three-phase current for industry and of distributing the power for railroads and industries through a single system of high-tension lines. Germany, Switzerland, Austria, Norway and Sweden have followed the policy of creating two separate systems of generation and transmission for industrial power and for transportation, the railroad power system being single-phase with a frequency of 16⅔ cycles while the general power system is three-phase and

50 cycles. He notes that the countries in which the railroads are privately owned have paid most attention to the general interests of the country, while the countries where the railroads are government-owned have neglected the advantages which might accrue from a single unified or interconnected power supply system.

### Conditions in United States Different

In the United States, of course, conditions are quite different from most of the European countries. Electrification has been adopted here for specific purposes in widely separated parts of the country. Each railroad has attempted to employ the system best adapted to its own particular problem. The results have been generally satisfactory with whatever system has been adopted, as is testified by the operators in each case.

There has not yet developed a general need for standardization on account of the overlapping of the various installations or of the necessity for interchanging equipment. This has resulted in the United States retaining an important position as a proving ground for all the best and latest improvements in electrification. Both direct current and alternating current are being extensively used, and the voltages vary from ordinary street-car practice up to 22,000 volts.

Among the equipment which can be used on any existing 11,000-volt system are the New Haven locomotives with series motors, the New Haven locomotives with motor-generator sets, the Norfolk & Western locomotives with induction motors, the Virginian locomotives with induction motors, the Great Northern locomotives with motor-generator sets and the Detroit, Toledo & Ironton locomotives with motor-generator sets. Thus there are in this country five widely separated roads performing entirely different services with locomotives of special type developed for their individual needs, but which could, if required, be operated over the same electrified system. Taking power in similar form, they have the separate advantages of single-phase, three-phase and direct-current motors for their respective duties.

There are also two railroads which have locomotives adapted to run on either 11,000 volts single-phase or 600 volts direct current. The motor-generator locomotives with 600-volt traction motors can also be adapted to run on a 600-volt direct-current supply. There is no present indication that the several well-established systems of electrification are going to decline in favor. It is not unlikely, however, that there will be further developments in the interest of interchangeability between roads as there have been in different motive-power equipment for varied duty on different divisions of the same road.

### Operation in the United States

A study of electrification during the year shows the same prevailing reasons for electrification which were emphasized last year, namely, to increase capacity, to improve service and to promote general economy. Long tunnels, mountain grades and the congestion of city terminals are underlying causes in the United States.

Up to date there have been installations of electrical operation on nineteen railroads in this country. The total mileage operated by electricity is about 1,800 miles of line and about 4,000 miles of track. Of all the roads concerned, this is about 2.5 per cent of the miles of line and 3.0 per cent of the miles of track. For the whole United States it is about 0.7 per cent of the miles of line. For comparison with the United States, there are in the world about 100 railroads with electrified sections in operation or under construction, distributed through 35 countries in all continents.

Of the nineteen roads, twelve are engaged in suburban and terminal operation around large cities. Seven operate over heavy grades and through long tunnels. Most of the terminal roads also have one or two tunnels ranging from a few hundred up to several thousand feet in length, the tunnels of the Pennsylvania Railroad under the Hudson River at New York being considerably longer than any of the others. The curvature on the terminal roads is only moderate.

The mountain roads have 89 tunnels, aggregating 327,000 ft. This is equivalent to an average of 3,700 ft. per tunnel, or 47,000 ft. of tunnel per road. The grades likewise are long and steep with ruling gradient as high as 2.2 per cent. The average ruling grade is 1.5 per cent for an average distance of more than 46,000 ft. In general, the curvature on ruling grade begins near the upper limit of the terminal roads and runs up as high as 12 deg.

### Equipment and Power

Of the nineteen roads, three operate passenger service only with electric power, four operate freight service only and twelve operate both passenger and freight service. The statistics for locomotives and motor cars are for the largest equipment on each road. Passenger locomotives are more nearly uniform in size than the freight locomotives and the horsepower varies from 1,000 to 4,000. The heaviest passenger engines are on the Great Northern Railway with a weight of 715,000 lb. Freight engines vary widely on account of some roads having only switching and way-freight service. The freight locomotives for trunk-line service range from 262,000 lb. up to 1,282,000 lb. and from 1,300 hp. to 7,000 hp. The heaviest locomotives are those of the Virginian, which are larger than any others in existence, either steam or electric.

Motor cars vary considerably in weight and seating capacity. The weight varies from 62,000 lb. to 176,000 lb. When used with trailers they are motored at 400 hp. to 1,000 hp, and without trailers at 240 hp. to 470 hp. About two-thirds of the roads use trailers with their motor cars.

### Power

The electric power used by seventeen of the nineteen roads in 1927 amounted to 1,585,000,000 kw.-hr. The generated power is slightly more in quantity than the purchased power, but there are more roads purchasing power than generating it. Twelve of the United States roads purchase all their power, while five generate all their power. The remaining two purchase about one-third of their power and generate the rest.

The energy used for passenger-train service varies about the same as in the city and interurban railway service, between 1½ kw.-hr. and 7 kw.-hr. per car-mile. The power used in freight service was reported by six of the railroads. These results vary from 25 kw.-hr. to 100 kw.-hr. per 1,000 gross ton-mile, indicative of considerable difference in the service performed by the roads and the character of the country through which they operate. Five of the roads have locomotives equipped for regenerative braking, but only two report the proportion of regenerated power as respectively 9 and 16 per cent of the total.

# Extend Rural Service to 21,217 Farms

By Charles F. Stuart

*Chairman Rural Electric Service Committee*

IT IS probable that no year in history has witnessed such significant developments in the application of electricity to agriculture as the year just closed. Farmers, farm organizations, agricultural colleges, the electrical industry, manufacturers of electrical equipment, manufacturers of farm machinery, governmental departments, all have been stepping harmoniously forward, overcoming obstacles, developing new facts, interchanging and spreading information, enlisting new recruits, building farm lines and putting electric power to work at more and more tasks on an ever-increasing number of farms.

During the year more and more electric light and power companies have organized themselves to undertake intelligently the extension of their service into agricultural territory. The year marked an increase of 60 per cent in the number of companies having either rural electric service departments or men especially trained in this particular field, and there is prospect of an even more material development in this line in the year to come.

No attempt was made to count the number of additional farms connected in 1927, as this work has now been included in the periodical electrical census taken by the Bureau of the Census, Department of Commerce. It is significant, however, that in four states, where electric utility organizations made such a count it is found that electric light and power company service was extended to 21,217 additional farms.

### Farm Load Good Business

Information received pertaining to organization, development and operation of rural electric service departments by several companies indicates that farm business properly undertaken can be made mutually satisfactory to farmer and power company. These departments prove by their own experience that in this supposedly most discouraging of fields an acceptable load in many instances can be and has been developed to the mutual satisfaction of both parties to the transaction. This has been accomplished by intelligent load building, by which is meant the application of electricity to agricultural tasks in such a way as to promote energy consumption and at the same time cut labor costs and increase farm production.

One of the biggest problems still remaining is that of acquainting the farmers themselves with the possibilities of electricity on the farm. Times have been far from prosperous for many of them. They have been too busy scratching a living out of the soil to keep pace with the rapid progress being made in the application of electricity to agriculture. To millions of them the vision of electricity on the farm is confined largely to a more acceptable type of illumination. They do not know that nearly 200 different services on the farm can be performed by intelligent employment of electricity. It is only within the last few years that definite information has been available, and as a consequence it often is found that in a given rural community only one-third of the farmers are alive to the progress which has been made and the relief from drudgery made possible by modern day application of electricity. It is also true that some utility organizations have not kept pace.

This problem of acquainting farmers with the modern-day idea of electricity on the farm is not discouraging at all. It merely means that such communities are not yet ready for electric service, but that as neighboring communities, more familiar with the situation, put electricity to liberal use on the farm, these more backward communities soon will profit by the example set.

### Rural Electric Service Departments

Only a few years ago the establishment by an electric light and power company of a rural electric service department was regarded as a very formidable and hazardous proposition—something of an adventure, to be undertaken, if at all, only after grave consideration and mature deliberation. That day, however, is past. Pioneers in the application of electricity to agriculture have blazed a conspicuous trail, marked by definite and specific information, and it is the prediction of this committee that within a comparatively few years every electric company occupying considerable rural territory will have a rural electric service department.

Creation of such a department is no longer an adventure, no longer difficult or hazardous. In fact, it is now regarded as the one logical and sensible way to meet the demand of agriculture for electricity on the farm.

The plan of procedure, once regarded as calling for much preliminary consideration, now is simple. The executive head of the company selects an individual, perhaps one already on the payroll, to take charge of this work. This selection, of course, requires some judgment, as the person picked should not only know the electric business, but also something of farming, and he should be what is termed sympathetic with agriculture. If he is not thoroughly up to date on the progress which has been made these last few years in putting electricity to work on the farm, he can speedily remedy that, for a wealth of specific information regarding electric farming in all sections of the country now is available to him.

Next there should be devised a rate. This should be no more difficult than devising a rate for any other class of business. The tendency among companies which have progressed in this field is for the company to finance all or a considerable part of the cost of building the line. In so far as the rate itself is concerned, the thought of principal importance is that it should be a form of rate which will encourage liberal consumption.

The next move is for a survey of the agricultural areas included in the company territory, taking into consideration the different types of farming, density of population, existence of present lines available for farm service, natural geographic boundaries, etc.

There is nothing very difficult, hazardous or intricate about any phase of this procedure. It is merely approaching farm service in a common-sense way, the same as electric companies have approached other classes of business. It is the only means by which requests for farm service can be met intelligently, and it is the only means by which the rural load can be built intelligently.

---

**Abstract of report presented at the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

## *N.E.L.A. Answers*

# Propaganda Charges

*The fifty-first convention of the National Electric Light Association issued the following official statement:*

THE NATIONAL ELECTRIC LIGHT ASSOCIATION has long believed that the success of the electrical industry in the performance of its public functions has been and must be based upon public confidence in its integrity, in its motives and in the character of its achievements. The association has believed, further, that that confidence could be based only upon knowledge and maintained only by a willingness on the part of the industry that the public should have the fullest details of the manner in which it operates.

The American people of today are electrically minded. In the space of less than half a century this nation has reached a state of advancement where the electrical industry furnishes and the nation usefully employs nearly as much electrical energy as the rest of the world combined.

As electric science has advanced the problems and business of the industry have grown greatly. This progress has been so rapid, one development crowding so fast upon another, that it would be difficult without adequate information for general public understanding to keep abreast of the advance.

Recognizing that lack of knowledge is as unfair to the public as it is harmful to the industry, the electric utilities consider it their responsibility to place all the facts before the public.

It is for these reasons that the Nationa Electric Light Association, among its other important functions in the development of the electrical industry, some years ago assumed the responsibility and adopted the policy of preparing and diffusing as widely as possible full, accurate and timely information on all phases of the business.

In this effort the association has encouraged the use of all proper channels for the diffusion of information concerning the industry and has made the facts available to newspapers, magazines, educational institutions and to teachers in public schools.

The truth of the statement, not the place where it is put, is the test. Full responsibility, openly avowed, for every word and act is desirable. All members of the association should scrutinize everything they say and do in the light of these principles, and to the extent which public investigation or public criticism of what we have done may aid in disclosing improprieties, should welcome it. We do not wish to be judged either by intemperate criticism or by our own declarations. We are ready to be judged by our accomplishments and our acts.

The National Electric Light Association in the interest of the public and its own will continue to make available to the public the facts on the progress and development of the industry, and to review from time to time the information distributed, in order that every assertion of fact, policy or principle shall conform to the highest standards of accuracy.

# Service the Answer*

## Economic and social aspects of the electrical industry reviewed. Federal control unnecessary. Holding company benefits

By Melvin A. Traylor
*President First National Bank, Chicago*

THE fact which most deeply impresses the layman is that the entire emphasis in the electric industry has been upon the objective of greater service to the public. In no activity more than the electric utility has the significance and spirit of the descriptive phrase "public service industry" been more fully exemplified. Better service has been the constant aim—service which is more reliable, more satisfactory and more adequate, and which is adapted to ever and more new uses. And better service has been translated by the leaders of your business into terms of constantly greater service to an ever larger proportion of our population, always with a constantly decreasing customer charge.

*M. A. Traylor*

It is impossible, it seems to me, to exaggerate the significance of the rôle played in our modern twentieth century civilization by electricity and, therefore, by those engaged in its production and distribution. It is probably safe to assert that during the past quarter century no force has been more influential in furthering social progress and human well-being. It has lessened the irksomeness of the laborer's toil; it has reduced the drudgery and routine work in the home; it has lifted many of the burdens of the housewife and lightened those that remain; it has lengthened and made immeasurably more satisfactory our hours available both for work and recreation; it has improved transportation and promoted a better diffusion of our urban populations. Rural electrification programs, such as have been sponsored by many electric companies, have done much for rural life. The electric switch has replaced the coal oil lamp, an instrument of historic service, as well as of smoke and of danger. The farmer now shaves as his wife churns by the same current, while the children project the latest movie in the front parlor—another institution of blessed memory.

And most significant of all, electricity has been harnessed to the machines of our industrial age and has added tremendously to the productive power and efficiency both of capital and labor. Indeed, we are led to conclude that the electrical industry has been one of the most potent forces in elevating the standards of life, or convenience and of comfort for the rank and file of our entire population.

Your industry has demonstrated to other industries the fundamental truth that enlarged and improved service is entirely compatible with sound business considerations. The great social service rendered by you has proved entirely consistent with your own business motives. Your product and sole stock in trade is service, and experience has demonstrated that the less costly and the more dependable your service the more diffused and intensive has become public demand for it. With that increased and better distributed demand have come better load factors, greater production, diminished costs of production per unit, reduced rates, larger sales of service and larger financial returns. Many other businesses in the United States could well profit through the lesson taught by the electric industry in pointing the way to increased prosperity through improved service.

Passing now to more specific problems and tendencies in the electric utility field, there are several which seem to me of peculiar significance.

### A New Concept of Regulation Prevails

Originally, the controlling motive leading to regulation of utilities by public authorities was to protect the consumer and to secure for him low rates. Indeed, this was undoubtedly the "prime mover" (to borrow a technical term from the electric industry) in originally instituting public utility regulation. Perhaps we should not criticise public officials for this, for there was on both sides in the earlier days a lack of perception of the real identity of interests between the community and the utilities which serve it.

---

*Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

But now it is becoming increasingly apparent to regulatory authorities, to city councils, state commissions and the courts, and even to the people in general, that rates must not only be not too high but also not too low. The public has come to recognize that otherwise not only will new capital be secured with difficulty and at greater cost, but that even existing service and facilities cannot be maintained. Regulation of rates is conceded by all to be necessary, but it is now becoming more widely recognized that they must be fair to all parties concerned—fair to users, fair to the owning companies and fair to the army of investors they represent. It is becoming more and more clearly recognized that if rates are too high an undue burden is placed on the users, and also that if rates are too low all parties suffer. For the inevitable result of regulation which is drastic or confiscatory is to divert investment capital to other channels, thereby making it difficult or impossible for the utility to provide the additional plant, equipment and facilities which are necessary to keep pace with the ever-increasing public demands for service.

This changed conception of the proper objectives of regulation has been due, in considerable measure, to the emphasis that has been placed by leaders in the industry and in the National Electric Light Association, through its public policy committee, upon better public relations, upon education of the public and upon the development of an attitude of mutual understanding.

*Rates must not only be not too high but also not too low.*

*Regulation by state commissions has fully justified itself.*

*Interconnection has decidedly lessened the significance of political boundaries.*

*Much good for the electric industry has been accomplished by the holding company.*

*Statistics show that propaganda for municipal ownership has not had any considerable effect in recent years.*

By way of parenthesis, I would like to remark that in my judgment we should recognize that the movement for regulation by state commissions has fully justified itself. Despite the lack of experience of some commissions in the early days and despite the fact that in a comparatively few instances the decisions of these bodies have not been entirely acceptable to those in the business, they have done much to further this newer concept of regulation. And I know of no form of governmental machinery or administrative device which is likely in the long run to prove more effective from the public standpoint, or more intelligent and fair, from the standpoint of the industry. It would, therefore, seem to be of the utmost importance that management should co-operate wholeheartedly and effectively with these bodies. That this association and its members have done so is happily apparent from the cordial relations which obtain between its members and the regulatory bodies.

The development of interconnection and long-distance transmission has been one of the most amazing technological achievements of the century. Its story is a commonplace to you all. A fact which occurs to me in this connection and which I hope is realized by most of our people is that interconnection and long-distance transmission have decidedly lessened the significance of political boundaries—of municipal and state boundary lines. There are many who feel that some character of governmental machinery must be adapted to meet the new situation.

Already the demand is being advanced, from certain quarters, that federal control is now necessary. It seems not improbable that the industry will have to recognize the inevitability of one of these three alternatives: (1) Regional control of some sort through regional boards; (2) regional co-operation in regulation upon the part of existing state bodies, or (3) some sort of federal regulation such as that exercised through the Interstate Commerce Commission.

The latter alternative would seem most unfortunate and undesirable. The Interstate Commerce Commission is already overburdened and the establishment of still another national bureau or commission would be necessitated. This would involve an extension of the tendency toward overcentralization of control in Washington, which has already been carried too far. This tendency toward centralization at the expense of the powers of the states is contrary to the fundamental principles of our dual system of government. But entirely aside from considerations of political policy or principles, federal control would seem unnecessary, as the problem involved is not truly national in scope. Rather, it is a regional problem. For example, the power situation in the Chicago area is not of concern solely to Chicago or to Illinois. On the other hand, neither is it a problem of national scope. It is a problem concerning Indiana, Illinois and Wisconsin for the most part, i.e., a regional problem.

It seems to me that either of the first two methods of control might prove sound—either some sort of regional board, formed by the joint action of the states, or perhaps preferably a program of co-operation between existing state commissions. Either plan might be effectuated through the use of the so-called "compact clause" of the constitution, which permits states, under federal authorization, to co-operate in the solution of regional problems of this sort. The compact clause has been utilized, for example, by New York and New Jersey in the joint control of New York harbor.

The same factor, i.e., the lessening importance of municipal boundaries, due to interconnection and long-distance transmission, will, I believe, defeat the home rule agitation, at least as it applies to the electric light and power industry.

Much good for the electric industry has been accomplished in recent years by the so-called holding company, but just here let me say that it seems to me peculiarly unfortunate that the term "holding company" should have been coined because, as a matter of fact, the holding company as we know it in the utility field differs little save in name from the more modern investment company or investment trust, the holding company being substantially a public utility investment corporation, with assets consisting of the stocks of utility operating companies.

By means of these companies it has been made possible to secure better and less costly financing, higher caliber managerial supervision, economies in purchasing, better engineering methods, and general reduction in overhead cost. To enumerate all the advantages of a holding company, or more properly the public utility investment company, would require more time than is available to me on this occasion, but no discussion of this subject would be fair which did not acknowledge the very obvious fact that except for these large holding or investment corporations, no such developments as have been recently witnessed would have been possible.

Through their ownership of widely scattered yet contiguous properties, they have been able to bring order out of confusion, harmony out of discord, and success out of failure, and the best of these achievements lies in the fact that they have benefited most those who are in the greatest need of such service—not the companies themselves, nor those who own their securities, but those who live in small towns, rural communities and, chief of all, those living on the farm.

Nevertheless, on every hand we hear proposals for the regulation of holding company activities. It is charged by the critics that holding companies are often subterfuges for avoiding regulation; that they are to a great extent merely "milking companies" to collect undue fees by means of special contracts with operating companies; that they indulge in undesirable financial manipulation and excessive pyramiding to the detriment of public utility credit. Thus far nothing concrete has come of these criticisms; no fraud on the investing public has been proved. None of a serious character probably exists. If here and there mistakes have been made, the advocates of sane policies and sound practices within the industry, and they are in the vast majority, are best prepared to handle the situation and should be allowed to do so.

It would seem that the regulation of operating companies by the various states through their commissions should suffice. Such regulation should meet the requirements of the situation, for the public is interested primarily only in local rates and in local service. Holding companies, as such, are of no more concern to the utility public or to the consumer than is any private investment organization.

I am convinced that holding companies need fear no serious attempt at regulation of their activities, so long as those activities bring benefit, or at least bring no detriment to the conditions of local service and local rates. So long as holding companies place no undue burdens on local companies, there is no adequate cause for regulation. However, if it should happen that any considerable number of holding companies should unreasonably divert earnings of local companies, exact excessive charges for various services, or inflict losses on investors and thereby impair public utility credit through an unsound and excessive amount of pyramiding, then extensive regulation on the holding company could be only temporarily postponed.

An analogous situation is to be found in the development of security issue regulation. At first, there was little attempt at regulation of security issues. Rates and service were the points of chief concern. But the belief, in some cases justified, that financial practices of certain companies not always engaged in the production of light and power as regards securities were adversely affecting rates and service, led to the extensive regulation of security issues which now prevails. Holding company regulation, if it should come, may conceivably be traced to similar circumstances. Agitation frequently concerns imaginary ills. But it is to be remembered that actual regulation is seldom instituted, or maintained, without some justification from the public point of view.

However, I am firmly convinced that such legislation will result only if those directing the development of the holding company movement put in effect unsound policies which in the long run will injure local operating companies, and thereby afford cause for public discontent. The sins of a few companies may be visited upon the entire group, once public indignation is aroused. I confidently believe that this result will be prevented by wise leadership within the industry itself. The best preventive for excessive government control is wholesome control from within. Certainly government regulation in this field is undesirable if it can be avoided. For in the field of management and investment—which constitute the chief functions of the holding, or public utility investment company—the highest degree of flexibility and elasticity is necessary. Regulatory "red tape" would inevitably prove a hindrance.

*A problem of major importance is properly to work out a balance between regulation and management.*

*I firmly believe that the electric industry will continue to be characterized by policies of fairness, open publicity and frankness, co-operation with public authorities and, above all, by scrupulously living up to all the implications of its position as a public service industry.*

### Faith in the Future

In general industry prosperity, the electric industry has participated, for its well-being is inextricably intertwined with that of the communities which it serves. Indeed, due to its rapid advances in technique and operating efficiency, it has been enabled, more than most industries, to maintain earnings while at the same time decreasing the price charged for its product.

I firmly believe that the electric industry will continue to be characterized by policies of fairness, open publicity and frankness, co-operation with public authorities, and above all by scrupulously living up to all the implications of its position as a public service industry, perfecting its machinery for self-regulation and control from within. If this proves to be the case, there is every reason to expect that it may confidently look forward to an era of still further development, expansion, and satisfactory earnings. Likewise, with such an attitude of straight forward policy prevailing throughout the industry, there is every reason to expect that regulation will prove to be neither confiscatory nor excessive, not encroaching unduly upon management, nor upon the incentives of private ownership and enterprise. Thus, it is to be hoped that the electric industry, while insuring fair prices to consumers and fair returns to investors, may become an even greater instrument for promoting social progress, economic betterment, and human welfare.

# The Power Industry in the Marketplace*

### By JAMES H. MCGRAW

*President McGraw-Hill Publishing Company, Inc.*

MUCH has been said and written about the need for more energetic methods of market development in the power industry. This is generally admitted. There is no point in my expanding this statement. But it happens also that it does not rest within the control of the power industry to delay action in this matter. For conditions are changing in the marketplace and the power company, that up to now has borne a charmed life because of the natural popularity of its production, is beginning to face and feel the opposition of an aggressive and resourceful competition.

I refer to the growing organized intercompetition between industries that is coming to be called the "new competition." And I submit to you that in future the sale of electrical energy and electrical equipment in the American market is going to depend less upon whether or not people should use the service. It will depend more upon whether or not they elect to spend those dollars for electricity or for something else which at the moment may have greater appeal.

For this new competition is itself engendering a new general philosophy of selection. It is teaching the public to discriminate—not necessarily as to what may be best, but what is most desirable. And just as we have come to learn that we cannot buy all the magazines on the news-stand, so America is beginning to realize that it must plan its purchasing more carefully because selection is becoming more difficult and because of the more deliberate process of modern easy payment buying.

The prevailing question today has become whether to apply available money to something electrical or to an automobile, a radio, a phonograph, a camera, furniture, clothing, shrubbery, or a more extended vacation. This mental attitude, as you know, as not been the outcome of accident. It is the result of ingenious and highly organized sales activity.

### INDIFFERENCE TO ELECTRICITY

At the present time in the neighborhood of 108 industries are engaged in concerted programs of co-operative promotion for the purpose of strengthening their positions in the marketplace, by securing the attention and developing the interests of the public. Almost every item of the family budget is now subject to the influence of these campaigns and they are effecting some remarkable changes in the relative sales of different groups of manufacturers. The walnut furniture manufacturers, the copper and brass producers, the paint manufacturers, the laundries, the florists, the icemen and all the rest of them are appealing and arguing for a larger share of that universal lodestone, the consumer's dollar.

James H. McGraw

And while this is all happening, gentlemen, while the American public is lending its ear to these ably presented messages of personal interest and is reacting to the influence of these suggestions, what does it hear and what does it care about electric service? To put it bluntly, if I may, while so many of these other branches of industry have been so actively and cleverly holding the attention of the people, the electrical industry has stood, not mute in the marketplace, but it has not made itself interesting. And when it has talked it has talked too often about itself.

Men and women are busy with their own affairs and they have not been bothering their heads about electricity all these years. The romance of our great industrial development, its spectacular financial expansion, the perfection of its tremendous networks and the magic of its ceaseless service, thrill and inspire us. But to the man on the street it is not nearly as wonderful and astonishing as radio or the motor car. To electrical men the present refinement of electric service, reaching well nigh every hamlet throughout this broad land and making available so many new contributions for labor saving, convenience and economy, is a dominating thought in life. But other men and women are far more consciously affected by the moving picture and by modern plumbing. This fact, I think, the power industry has failed to appreciate and analyze and to reckon with.

---

**Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

It is precisely to this point that I desire to direct your attention—to the point that it is a new kind of a market that we are facing today in the power industry. It is a highly competitive market and a market competitive not so much between manufacturers as between appeals. Success in such a market is very dependent upon three simple elemental factors: First, the quality of the product offered; second, its presentation and, third, both in place and importance, I think, its price. I would like to comment upon the position of electricity in the new marketplace from these three aspects.

As to quality, our case is clear and strong. There is no acceptable substitute for electric service in most of its common applications. Humanity admits its marvelous power and admires even when it does not adopt. The dependability and perfection of the physical service provided by the modern central station is completely satisfying. Quality, then, we may say, is unquestioned.

In the presentation of its product, however, I think that the electrical industry stands at a disadvantage today. And I have not forgotten that the power companies spent $10,000,000 for advertising in 1926, according to the last available report of your committee on advertising. But let us examine into this expenditure.

That year the power industry enjoyed a total revenue of $1,652,000,000. It therefore appropriated about six-tenths of 1 per cent of its gross income for the purpose of telling its story to the public. However, $3,700,000 of that expenditure was for good-will advertising, $1,000,000 was for supporting the sale of securities, $4,300,000 went to advertise appliances and the remaining $1,000,000 was devoted to promoting electric service of all kinds. Does it occur to you that only the last two items are of any particular influence in the marketplace?

What you say to the public about appliances and about lighting or power or some other form of service applies directly to the industry's sales problem and registers in the new competition. But the advertising of securities, while entirely constructive and desirable, is a matter of financing and a matter of general good will. It does not directly sell either service or equipment. And good-will advertising, while desirable in reasonable proportion, does not close sales, although it creates favorable sentiment. Therefore, 47 per cent of the power industry's advertising was directed to general purposes and only 53 per cent of the advertising expenditure was directly contributed to increasing the public interest in the actual things we have to sell and are urging them to buy. Our advertising appropriation to support our salesmen in the marketplace, therefore, figured about three-tenths of 1 per cent.

### WHAT OTHERS SPEND

But other industries that sell the popular market have learned that an adequate presentation costs more than this. Three cigarette manufacturers, for example, together spent $54,000,000 in advertising last year. And to compare percentages, one leading manufacturer of motor cars spent 3 per cent, a leading soap firm 2 per cent, a large paint manufacturer 3½ per cent. And so it goes. The contrast is striking.

Of course, the popular advertising of electrical manufacturers is a further contribution to the telling of the story of electricity, but this does not bulk large enough to upset the argument. A glance at the comparatively small weight of popular advertising that is advocating anything electrical amidst the pressure of promotion devoted to other appeals gives impressive proof that we are not making our voice heard in the marketplace. Moreover, the power industry cannot and should not depend on the manufacturer to popularize electric service. His first responsibility is to sell equipment. The central station must do its share of the market building and that share should be a generous one.

I would say, then, that the power industry is spending entirely too little money for advertising to make a strong presentation of its product. Instead of the $5,000,000 or so which your committee says was spent in the newspapers for this purpose last year, I believe the appropriation should be not less than 1 per cent of the industry's gross income. If it were 2 or 3 per cent for the whole industry, it would still be less than the three cigarette manufacturers spent last year.

I would say also that the power industry is spending entirely too large a proportion of its advertising appropriation for indirect appeal. I believe that in the past the executives of the electric power companies have made the very common error of inclining toward the kind of advertising that interests them and their friends instead of the kind that concerns the general public. Utility good will advertising appeals to the electrical man. It can be made extremely valuable in interpreting the policies of the company and its service to the community. But by and large, the average citizen is far more interested in an advertisement that tells him about something that he wants or could use.

### STRENGTH OF DIRECT APPEAL

As a general rule advertising that increases a man's interest and confidence in the use of electricity will build more good will than an advertisement designed to increase his interest and confidence in the utility company. He buys light or power or industrial heat. His wife can use a clothes washer or a refrigerator. They do not contemplate buying a power company. And they naturally assume and expect that electric service will be good and that the company will grow and deal fairly with the public. The very large proportion of good-will advertising—for much of the security advertising has a good-will purpose—I believe, is a direct reflection of the fact that the power industry has permitted itself to get into a defensive attitude in the relationship which it sustains with the public.

We forget sometimes that the strength of the automobile industry lies in the popularity of the motor car, not in the virtuous reputation of the automobile manufacturers. Automobile advertising talks not about companies but about cars. Electrical advertising, in my opinion, has its greatest sales and good-will value when it talks specifically about electric service in terms of definite uses and not about the central station. If you like your car you have no complaint against its manufacturer. If electric service has become a matter of your daily life and tied up with the habits of your home and the practice of your store or factory, you are well sold on the value of the power company to you.

### THE RIGHT TO SELL

There is a case in point, I believe, in the current criticism of the public utility associations for their expenditures in the presentation of their arguments against the proposed entry of the federal government into the power business. It lies not in the size of these appropriations. For in relation to the capital invested or the total revenues represented, they were not large. They seem small when we consider the menace of such political privateering upon the public service and the danger to the savings of the millions of investors involved, should such false economic doctrine prevail. But public attention is arrested by the fact that this money was spent for defense and the man in the street asks, Why?

Ten times that amount could have been spent in constructive advertising without comment. For America is accustomed to huge expenditures for market building. Men marvel at the amounts appropriated to advertise motor cars and talking machines, chewing gum and silk stockings. But they never question the business judgment of these manufacturers. The policy has proved itself sound before our eyes.

I believe that once this idea is made clear in this industry there will be no objection or opposition on the part of the regulatory commissions to large, properly balanced advertising expenditures by public utilities. I suggest that it would be well to analyze the comparative expenditures of this and other industries for market development, and to establish with the utility commissions the economic soundness of spending money courageously to increase the volume of sales per customer in order to make reduced rates possible. No one questions the right of a Wrigley or a Ford to advertise to this purpose. Why is it less sensible to promote aggressively this other merchandise? Every business has an inherent right to sell.

### Luxury Now the Vogue

Again in the matter of the price of electricity, I have the feeling that as an industry we lack confidence and courage in our own values. Power companies have too often adopted a defensive policy on rates. But there is nothing wrong with the cost of electricity. The price is not too high. It stands alone in its record decline among all the costs of living. Electric service is worth more than it costs today, reckoned against comparable services or commodities. And I believe that the present tendency among the power companies is to reduce rates too rapidly, forgetting that the whole psychology of America today inclines toward luxuries and is indifferent to the economy appeal.

I wonder if we are not making a mistake in talking too much to the public about the utility of electric service. As a matter of salesmanship, is not its luxury its most attractive feature to the rich and to the humble home alike? Review the outstanding examples of spectacular success in the popular market and it is striking that most of these products that have become the vogue in America and established themselves in modern life lie in the luxury class. Automobiles, travel, moving pictures, phonographs, radio, cameras, tiled baths, silk stockings, perfumes, cosmetics, safety razors, candy and cigarettes have all come into universal popularity through the luxury appeal. This experience cannot be ignored by electrical men. "Give us the luxuries of life and we will dispense with the necessaries," said a humorous philosopher, with a keen insight into human nature.

### Price Courage

It is the practice in the American marketplace to advertise in order to increase sales and effect a larger production that will reduce the cost and make possible a lower price, which in turn will stimulate more sales. The power industry, in my opinion, has pursued a policy of reducing rates without sufficient provision for the development of the market. A rate reduction may save a million dollars in a year to the people of a city, but after the announcement is forgotten the small decrease in the monthly bill goes practically unnoticed. If that million dollars were to be expended in that single year in local newspaper display advertising, supported by such direct mail, billboard and other attention-compelling methods of display as might be effective, can any one possibly doubt that electric service would win far more popularity and probably enough additional load to provide for the same decrease in rates without reducing revenues?

After all, rates are not such an intricate scientific affair. We need not fear them. The rate is just the price of a commodity that must be sold in competition in the marketplace. It must cover production, cost and overhead and yet facilitate the selling. For this reason the so-called inducement or promotional type of rate gains steadily in acceptance in the industry. It encourages larger sales to the individual customer. And that has been a profitable feature in prices always. For the price of a piece of merchandise cannot be fashioned for the convenience and gratification of the seller alone. The prime requisite is that it should encourage the customer to buy.

The industry needs rates that will help extend the more complete use of electric service by every consumer, but the power company must have price courage and not give away in premature rate reductions the millions that should be spent in the development of the market. For it is more in the public interest that the comforts and economies of electricity be brought into universal use and made less expensive by the consequent increased production than that it be cheapened by price cutting before adequate money has been spent to build the market. So it is with us.

### Man Power for Sales

It is into this kind of an arena of large-scale merchandising that the power industry is now entering. And given the quality and given the presentation and given the price, there is one other essential without which success cannot be expected. And that is man-power. Fortunately the power industry is already well supplied in sales personnel. It has in recent years recruited an able staff of commercial-minded men who are eager to go forward. When the executive interest and backing and the financial appropriations needed for the larger operations are provided there need be no question of the capacity of the industry to play its part in the marketplace.

For the development of the popular market, the selling of a complete use of electric service in the homes of all the people one other resource is vital. There is need for the upbuilding of a strong and prosperous independent retail trade in every community. The power industry cannot sell merchandise in adequate volume unaided. It needs a broad skirmish line of active dealers at every neighborhood center of household supply, each contributing his share to the growing load. It needs an army of contractors at work installing adequate wiring that the use of everything electrical may be made natural and easy. The encouragement and guidance of this independent trade to a progressive co-ordination will need leadership, sound policies and unselfish patience. And this will be forthcoming.

I have an abiding confidence and an increasing enthusiasm for the power industry. It has grown great in a service that has won the plaudits of the world. It has triumphed in invention, in engineering, in finance and in administration. It brings to the new problems of this oncoming commercial era resources that will carry over all obstructions. It will not fail to win new honors in the marketplace.

# Water-Power Development*

By PAUL A. SCHOELLKOPF
*Chairman Water-Power Development Committee*

*Paul A. Schoellkopf*

THERE has been no outstanding development in either the theory or utilization of water power during the year, although some progress has been made in both lines.

The efficiency of hydraulic turbines has been improved to the point where it seems there is little room for betterment. As in the design of electric generators, the efficiency is now so high that a nearer approach to 100 per cent can scarcely be expected. Improvement in details has resulted in reaction turbines being placed in service during the year showing an efficiency of 94 per cent over a considerable range. Perhaps the most promising field for water-wheel improvement at present lies along the lines of greater efficiencies in low-head wheels with higher speeds and corresponding lower costs.

There is much interest among hydraulic engineers at the present time over tests on the experimental Stevenson Creek Dam in California and also on the use of small-scale models in hydraulic studies.

### FEDERAL POWER COMMISSION'S REPORT

During the year the Federal Power Commission issued nine preliminary permits involving 419,407 hp. primary capacity and an estimated installed capacity of 772,800 hp. Eighteen major licenses were issued involving 85,571 hp. of primary capacity and 574,880 hp. of ultimate installed capacity. Twenty-two minor licenses or licenses for minor parts of complete projects were issued involving 43,553 hp. primary capacity and 80,928 hp. of ultimate installed capacity.

Eleven projects were completed or put in operation during the year with an aggregate installed capacity of 217,694 hp. The principal among these were:

| | Horsepower |
|---|---|
| San Joaquin Lt. & Pr. Corp. (Calif.) | 42,200 |
| Louisville Hydro-Electric Co. (Ky.) | 108,000 |
| North Western Pr. & Lt. Co. (Washington) | 16,500 |
| Inland Pr. & Lt. Co. (Idaho) | 10,880 |
| Chelan Electric Co. (Washington) | 33,000 |

Thirty-one new projects having an installed capacity, when completed, of 362,000 hp. have been started during the fiscal year ended June 30, 1927, bringing the total of projects completed or under construction at the close of the year to 128 with a proposed ultimate installation of 4,610,000 hp.

### SOME POWER DEVELOPMENTS IN 1927

An unusual hydro development is the Rocky River plant of the Connecticut Light & Power Company in Connecticut, where electrically driven pumps are being installed to use off-peak power to pump water into a high level storage reservoir. This practice is common in Europe but this is its first large scale use in the United States.

At the Buck's Creek plant of the Feather River Power Company a foreign made banded penstock has been installed operating at a static head of 2,561 ft. Seventy thousand horsepower will be developed in two impulse turbines. This is the highest head plant in the United States.

The largest power development now under construction is the Conowingo Dam and power house on the Susquehanna River, being built by the Susquehanna Power Company, a subsidiary of the Philadelphia Electric Company. A total of 378,000 hp. in seven 54,000-hp. units is to be installed under the present contract and provision is being made for four more units of the same capacity. The first units were started early in 1928.

### DEVELOPED WATER POWER IN THE UNITED STATES

The United States Geological Survey reports that on Jan. 1, 1928, the developed water power in the United States in plants of 100 hp. or more was 12,296,000 hp., showing an increase of 575,000 hp., or 4.9 per cent, during 1927. The figures for recent years are as given in the following table:

| Date | Horsepower | Increase Per Cent |
|---|---|---|
| 1921 November | 7,926,958 | |
| 1924 March | 9,086,958 | 14.6 (2.3 yr.) |
| 1925 March | 10,037,655 | 10.5 |
| 1926 Jan. 1 | 11,176,596 | 11.3 (0.8 yr.) |
| 1927 Jan. 1 | 11,720,938 | 4.9 |
| 1928 Jan. 1 | 12,296,000 | 4.9 |

The distribution of this capacity among the states is as follows:

---

*Abstract of report presented before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

| | State | Horsepower | Per Cent of U. S. Total |
|---|---|---|---|
| 1. | California | 1,992,000 | 16.2 |
| 2. | New York | 1,786,000 | 14.5 |
| 3. | Washington | 702,000 | 5.7 |
| 4. | Alabama | 652,000 | 5.3 |
| 5. | North Carolina | 640,000 | 5.2 |
| 6. | South Carolina | 579,000 | 4.7 |
| 7. | Maine | 541,000 | 4.4 |
| 8. | Wisconsin | 480,000 | 3.9 |
| 9. | Georgia | 469,000 | 3.8 |
| 10. | Michigan | 381,000 | 3.1 |
| | All others | 4,074,000 | 33.2 |
| | Total | 12,296,000 | 100.0 |

From 1922 to 1925 inclusive the average annual increase in installed capacity in hydro-electric plants was 9 per cent. In 1926 and 1927 it was 4.9 per cent. While the period is too short to make these figures conclusive in themselves, they correspond so well with the known conditions that it seems safe to say that we are facing a slowing up in hydro-electric development. Two factors are principally responsible:

1. The remarkable reductions in steam power costs in the past five years have made many water-power projects economically unattractive today that looked attractive five years ago.

2. Political controversies and restrictive state laws have for the present prevented developing most of the larger and more feasible water power projects.

The United States Geological Survey estimates the total developed and undeveloped water powers of the United States available 50 per cent of the time at 59,000,000 hp., corresponding to about 80,000,000 hp. installed capacity. The 12,296,000 hp. installed corresponds, therefore, to 9,600,000 hp. available 50 per cent of the time and leaves 49,400,000 hp. still undeveloped.

Of this amount the following are held up by political controversies, international negotiations or restrictive state laws:

| | | Horsepower |
|---|---|---|
| 1. | Various rivers in Maine | 630,000 |
| 2. | St. Lawrence River | 812,000 |
| 3. | Niagara River | 2,437,000 |
| 4. | Potomac River | 360,000 |
| 5. | Cumberland River | 126,000 |
| 6. | Tennessee River | 2,000,000 |
| 7. | Colorado River | 5,767,000 |
| | Total | 12,132,000 |

It should be noted that the figures in the above list are taken from the United States Geological Survey inventory and represent all the power that it is physically possible to develop. For various reasons it is quite unlikely that all this power can be developed on the Niagara and Colorado Rivers.

### MANY DEVELOPMENTS NOT NOW POSSIBLE

The following large water powers have been studied in recent years and while some of them can be developed at low cost they have been found, with certain possible partial exceptions, to be unfeasible under present economic conditions:

| | | Horsepower |
|---|---|---|
| 1. | Monongahela River | 218,000 |
| 2. | Red River | 115,000 |
| 3. | Missouri River | 2,800,000 |
| 4. | Flathead River | 877,000 |
| 5. | Columbia River | 7,977,000 |
| 6. | Snake River | 5,612,000 |
| 7. | Deschutes River | 734,000 |
| | Total | 18,333,000 |

Of the remaining 18,935,000 hp. probably less than 30 per cent, or 6,000,000 hp., can profitably be developed under present conditions.

To sum up, an analysis of the United States Geological Survey inventory of the 59,000,000 hp. available in the United States shows that 9,600,000 hp., or 16 per cent, is developed, 6,000,000 hp., or 10 per cent, will probably be developed in the near future, 12,000,000 hp., or 20 per cent, which probably is economically feasible is being held up by political controversies or restrictive state laws, and the balance, 31,400,000 hp., or 54 per cent, probably cannot be profitably developed under present economic conditions.

The results of this analysis check fairly well with figures given by Major Glen E. Edgerton, chief engineer of the Federal Water Power Commission, in an address before the Mid-West Power Conference Feb. 15, 1928.

A summary of Major Edgerton's figures is:

| | | Horsepower |
|---|---|---|
| 1. | Total water power in U. S. (50 per cent of time) | 55,000,000 |
| 2. | Corresponding installed capacity | 75,000,000 |
| 3. | Probably 75 per cent of this is under federal jurisdiction. | |
| 4. | Installed capacity Jan. 1, 1928, about | 12,000,000 |
| 5. | Licensed by Federal Water Power Commission, but not constructed | 4,000,000 |
| 6. | Under preliminary permit from F.W.P.C. | 5,500,000 |
| 7. | Applications not acted upon | 15,000,000 |

Item 5 includes several projects with construction periods of fifteen years or more.

The casualties in preliminary permits up to date have been so heavy that it would be conservative to assume that not more than 75 per cent of item 6, or 4,125,000 hp., will be found feasible.

Item 7 includes projects on the St. Lawrence, Tennessee, Colorado, etc., held up by political controversy and amounting to about 12,000,000 hp.; the balance of the 15,000,000 probably is not feasible.

If it be assumed that the undeveloped water powers not under federal jurisdiction have the same relative probability of development as those under federal jurisdiction and that the ratio of power available 50 per cent of the time to installed capacity is 55 to 75, the following may be deduced from Major Edgerton's figures:

| | | Horsepower | Per Cent |
|---|---|---|---|
| 1. | Total water power in U. S. available 50 per cent of time | 55,000,000 | 100 |
| 2. | Total developed water power, January, 1928 | 8,800,000 | 16 |
| 3. | Development probable in next ten to fifteen years | 5,900,000 | 10.7 |
| 4. | Development probably feasible if political controversies be adjusted | 11,000,000 | 20 |
| 5. | Probably not now economically feasible | 29,300,000 | 53.3 |

Until developed, water power produces nothing; when developed it continues to produce indefinitely, not being depleted by use, as are most other resources. The importance of developing the water powers that are feasible of development needs no argument. In fact, for the past twenty years the importance and value of water power resources have been so extravagantly urged upon the public by conservation enthusiasts, government operation advocates and others that no sane and reasonable policy of dealing with the development of water power has been able to exist for long. In June, 1920, after twelve years' discussion in Congress, the federal water power act was passed. In spite of its proved adequacy to protect the public interest under all conditions, whatever else may be said of it, it has been subject to annually increasing attacks until it has become, temporarily at least, inoperative with respect to many of the larger and more feasible power prospects.

The following is a statement of electric energy developed in the United States by hydraulic plants 1921 to 1927 inclusive:

| Year | Kw.-Hr. | Per Cent Increase |
|---|---|---|
| 1920 | 16,150,000,000 | .. |
| 1921 | 14,970,000,000 | —7.3 |
| 1922 | 17,207,000,000 | 15.0 |
| 1923 | 19,343,000,000 | 12.4 |
| 1924 | 19,969,000,000 | 3.2 |
| 1925 | 22,356,000,000 | 12.0 |
| 1926 | 26,189,000,000 | 17.1 |
| 1927 | 29,875,000,000 | 14.0 |

It will be noted that the increase in kilowatt-hour output does not correspond directly with the increase in installed capacities heretofore given. This is due principally to the variation in rainfall from year to year.

The average kilowatt capacity during 1927 of the hydro plants reporting to the Geological Survey was approximately 6,970,000. The average kilowatt capacity during the same period for the fuel burning plants reporting was about 19,580,000. The following table shows the average capacity factor at which the hydro and steam stations operated in 1927:

|  | Capacity Kw. | Output, 1927 Kw.-Hr. | Equiv. Continuous Kw. | Capacity Factor |
|---|---|---|---|---|
| Hydro stations | 6,970,000 | 29,875,000,000 | 3,410,388 | 48.9 |
| Steam stations | 19,580,000 | 50,330,000,000 | 5,745,434 | 29.3 |

There has been no water-power legislation enacted by Congress so far this session. Several bills for the disposition of the government property at Muscle Shoals have been introduced. In the meantime, the government plant at Muscle Shoals is being operated by the War Department, and the power is being sold under a revocable contract to the Alabama Power Company.

The Swing-Johnson bill providing for the construction of the Boulder Canyon dam has again been reported out favorably to both houses of Congress. The principal opposition to this measure has been due to the inability of the seven states in the Colorado Basin to agree upon an interstate compact for the division of the water. Efforts to procure an agreement between the states have been persistent during the past year, but so far without success. Without such agreement the legislation probably cannot pass both houses at this session. In the meantime an understanding of this project seems to be spreading. If the project were really understood by the country at large it would have no chance of being adopted, for it is primarily a project to subsidize political ownership and operation on a scheme that is unsound from both an engineering and an economic point of view.

Bills are again before Congress for both the Umatilla and Columbia Basin projects on the Columbia River, but even their supporters seem to have no expectation of procuring action at this session.

Perhaps the most important federal activity pending relative to water resources is the surveys provided for in the last rivers and harbors act in accordance with the report of April 12, 1926, of the Chief of Engineers and the Federal Power Commission. These surveys were given considerable prominence in connection with the Mississippi flood problem. Many localities are pressing for early completion of them with the expectation that they will, through the plea for local flood control, prove the means of obtaining federal contribution toward local irrigation or power projects that have not been able to get launched on their own merits.

A recent exchange of notes between the United States and Canada indicates that negotiations for carrying out the combined navigation and power project on the St. Lawrence River may be resumed in the near future.

# Why the Investment Company*

"CONSTANT demand by the public for improved service and higher quality of production has necessitated concentration of capital in increasing amounts. As the American people are rightly opposed to government or municipal ownership of utilities, this means that these great enterprises, requiring investment of enormous sums, must be made inviting to investors; otherwise they will seek other fields and the utilities will go begging for capital and public support."

This was the keynote of the address of Arthur W. Thompson, president United Gas Improvement Company. He went on to review the evolution of industry, particularly of the utilities, from ownership by a few partners in local companies to control by investment companies and operation under a management system that has proved far more efficient and economical. Public utilities, he said, are being regrouped according to economic interests along defined geographical lines. Hand in hand, there has been proceeding a widening diffusion of stock ownership, the tendency being to divorce ownership from management. There are now 5,500,000 security holders of utilities, as compared with 500,000 about 25 years ago.

"The managers of these large companies," Mr. Thompson said, "are agents for all the stockholders or owners and hold their positions at the will of the stockholders. Their positions can be secure only through honest management, high business ethics and high moral standards, which brings into public service high-class, well-trained professional men.

"The investment company, by reason of its supervision of a large number of properties, is enabled to maintain a staff of technical experts, each skilled in his particular line, whose services always are available to the operating company. Through the investment company the needs of the local operating company, which are increasing rapidly, are financed on favorable terms." The investment company, the speaker asserted, assures the best of engineering. Its accountants subject the operating results of the local company to close monthly analysis, making for strictest economy in operation.

"The function of the investment company is getting more and more to be that of adviser, and the authority to manage and operate is being more and more localized in the hands of the local officers of the company," he said. "The problems from now on will be national rather than local in scope, and public utility executives must begin to think in terms of national problems, realizing that anything one group does affects not only that particular group but the entire industry. The standard of performance must be not whether a given policy is legal but whether it is in the public interest."

---

**Abstract of address by A. W. Thompson, president United Gas Improvement Company, before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

# Industry and Business Schools*

Professional business school result of changed business conditions. Industry co-operation essential to success. Progress of industry constructive

By Deane W. Malott
*Harvard School of Business Administration*

*Deane W. Malott*

THE reasons for the rapid growth of schools of business are not obscure. With the dissolution of the army in 1919, men who had been trained in the pursuit of war, recognizing the advantages of specific intensive training, sought entrance to the business school as a preparation for their life work, with the result that twice and three times the expected numbers sought admittance to the schools of business in that year. Then, too, with the growing complexity of the business unit has come the need for trained men to fit into organizations where one man's capital, labor and knowledge are not sufficient, as they once were, to direct the business efforts. The organization has not always functioned well, and even today we have great problems yet unsolved which are calling for all the intellectual power, all the idealism and all the sportsmanship which we are capable of producing.

Hence, business schools have taken a place in the educational scheme of things and give promise of having started on a career of importance to business. Now, what may you men of industry expect from this educational mushroom? We hear rumors, and occasionally see something in print, concerning the new profession of business, and we have come to realize that the world needs sadly this new profession. But the visibility is low, so to speak, and we see obscurely into the meaning of the term. Obviously, there have been many professional men of business, but it is safe to say that business, the profession, is only now emerging. Its problems and tasks, however, have not waited at all. They loom large on the business horizon.

The difference between the old-time business and the emerging profession of business today is the result of the effort to establish guiding principles, underlying fundamentals, recognized by the leaders of industry and trade, as being the guides to navigation in a previously uncharted sea. It is the result of the emergence of ethical standards governing accepted practices and methods of procedure. It is the result of a rising consciousness of the social responsibilities of the business man, along with his business activities. These together are weaving the enduring web of a business tradition, to the pattern of which each leader of industry may contribute the example of his efforts. In the upbuilding of these professional aspects business education must assume a leading part if it is to fulfill its prophecy of service. But the graduate of the business school is no more a full-fledged swivel-chair business executive than is the interne from the medical school a skilled surgeon or the graduate of the law school a seasoned court lawyer. Experience and judgment, a knowledge of the particular technique and the confidence of his fellow-man are important ingredients to be added when he has left the academic halls, and they may require years to attain.

What, then, is the object of the training offered by the schools of business? We are all attempting in the first place to teach men to think. At Harvard we have substituted for the method of teaching by precept the analysis and diagnosis of actual problems collected from business. Our research men are constantly at work seeking from business men data concerning the actual problems which face them. In the discussion of these problems the student arrives at a reasoned judgment, and underlying economic and business principles are brought out where possible. In the course in public utility management, for instance, the problem of regulation is approached from the actual court and commission decisions, and the question of rate determination has as its basis actual problems surrounded by the necessary facts and theories for its determination. The student thus acquires a method of approach of far more importance than the facts themselves, for business is dynamic and facts as they exist today will not hold true in the day in which these young men assume their responsibilities in industrial affairs.

---

*Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

But the relation between the schools of business and industry goes far deeper than the training of young men for business life. From you men and from those in other fields must come the teaching material, and the soundness and wisdom of our instruction is in large measure dependent upon your co-operation in allowing us to keep in constant touch with the measured tread of progress in industry and trade. No school of business, if it is really to serve industry, can be a thing apart from business activity. Our research men are constantly in the field, and in the process of obtaining teaching material we are building up for you an ever growing background of economic data which may guide you on your way. And the men of business have been everywhere co-operative and generous of their time and strength, not only in giving us often the intimate details of their problems, but in bringing personally into the classroom their counsel and experience.

*Business as a profession is just emerging.*

*The large corporation in its process of development generally tends to elevate itself to higher ethical standards, and there inevitably creeps in more of a feeling of trusteeship, not alone for the security holder, but for the employee and the community as well.*

*The social responsibility of the business man is inescapable.*

They have given financial aid to the development of business research and teaching. Trade associations and individual business concerns and business men have practically supported the research work of the Harvard Business School, which is providing teaching material for more than a hundred other business schools throughout the country. The students can through their tuition pay the instructional costs, but obviously the costly research necessary to provide teaching material in the various fields of business cannot be covered by tuition charges and can come only from the far-visioned leaders in industry who realize the importance for the future of the intellectually trained man.

Within the last five years public utility instruction has been added to the curriculum of the Harvard Business School. In this audience are many men from concerns which for the last three years have been giving their financial support to the development of public utility management, teaching and research in the Harvard Business School, and you may be interested therefore in a report of progress. This money has been spent to help pay for instruction in a course in public utility management advice concerning which has never been sought from nor given by those contributing to this support; to collect several hundred actual problems, from commission and court decisions and from concerns in the public utility industries—all factual incidents reported for class use and published as a collection of cases—and to produce a detailed and inclusive factual study on "the interstate transmission of electric power," published without comment as a compilation of facts and of specific use to us as teaching material. Wherever material resulting from our studies is of direct and immediate interest to the business world it is made available, and factual studies are published from time to time.

This is not only typical of our relations with other industries, where in several different fields groups of business men are helping us in the furtherance of knowledge and research, but I believe is typical of the sort of effort going on in other professional schools of business. And the support of this industry and of other industries to the professional schools of business has made possible the development of intellectual training for business, the establishment of business principles, and a basis for creating a professional motive in the young men entering business which otherwise would never have been possible.

### ETHICAL STANDARDS IMPROVE

Naturally funds come from the larger units and groups in industry—from those groups where power is often associated with some sinister purpose. The "soulless corporation" is constantly held up as the great example of unethical operations, although seldom is it deserving of this characterization. The large corporation in its process of development generally tends to elevate itself to higher ethical standards, and there inevitably creeps in more of a feeling of trusteeship, not alone for the security holder but for the employee and the community as well. This ethical evolution goes on because through the years a large organization must be reasonably trustworthy in its complex internal operations in order to continue to conduct the business service which is the purpose of its organization. It must, therefore, choose trustworthy men for its organization, and a group of men who so conduct themselves that their associates can trust them will over a period of years be the type of men who are trustworthy in dealing with their public. We are all more sure of an honorable trade with the great national corporation than with the man in the fruit stand at the corner. Moreover, the big corporation generally emphasizes stability and permanence, rather than immediate profits, with the result that its policies are determined for the long run and that more consideration is given to factors of ethical importance than might otherwise be the case.

### BUSINESS RESEARCH IMPERATIVE

Moreover, it has long been recognized that sound business practice must rest on firmly established research into the facts and economic principles of business. A concern which operates its own research department is looked upon as outstandingly progressive in bringing to its highest fulfillment the service it offers to the public. It certainly is no less far-visioned to make possible through financial support industrial studies by the schools of business, where adequate research organizations are set up, away from the firing line of conflicting motives and prejudices, and where men are dedicated to the search for truth.

It is also an accepted principle in the development of business to build up public recognition through advertising and to attract the most capable men into the industry. Certainly it is in keeping with this policy to provide ample opportunity for the training of young men in the problems of the industry, in the schools of business.

Young men are challenged by the problems which business offers.

Let there be more and still more co-operation, therefore, between industry and the schools of business, for the opportunities are legion and time is running against us. Two hundred years of adventuring in the realm of science has opened constantly new and larger opportunities for progress and for the culture and comfort of modern civilization.

Owen D. Young, in an address at the dedication of the buildings of the Harvard Business School a year ago, said: "I can see a picture of the adventurers in pure science moving out into unknown fields as the great geographical explorers set sail for unknown lands. Following them are the applied scientists learning how to use the new forces just as the early settlers followed the old adventurers. Finally, business organizes itself to harness these forces and put them to work. Never were opportunities so great as now. Never did unexplored areas seem so vast. Never was there a more responsible trusteeship needed for the discovery of new opportunities or for the administration of existing powers. We need today more than ever before men to administer this trust who are not only highly skilled in the technique of business, men who have not only a broad outlook in history, politics, and economics, but men who have also that moral and religious training which tends to develop character."

### SOCIAL RESPONSIBILITY INESCAPABLE

This is a challenge to the combined efforts of schools of business and industry. If it is to be met, we must develop men fundamentally capable of meeting the social responsibilities which business men more and more will have to assume. Religion is fraught with dogmas, political leadership is losing ground, science has created a materialistic world, and on all sides complicated questions of social relationships press for solution, and the leaders to attack these problems are strangely missing. Yet the social responsibility of the business man is inescapable. It involves the job of raising industry itself, from within, up to a higher ethical plane, a plane which is not socialism, nor communism, nor government operation, nor the exercise of the police power, but rather a great development from within the business itself of a sound and effective control of industry, its relations with labor, with its customers and with the public.

The co-operation of business schools and industry is no easy task. It calls for breadth of view, for perspective and for patience. Problems of right and wrong arise with such constant frequency that the need for careful thinking and high standards is especially great. You men in business are constantly dealing with moral issues. The moral strain to which the young man is subjected in entering the ministry, medicine or teaching is far less than in law or business. Material success is a temptation for which we may too readily subordinate the ethical and cultural aspects of life, and this temptation is far greater in business than it is in the other professions.

On the other hand, if one realizes that all types of service which are open to the young man entering the other professions are also open to the young man entering industry, there is a tremendous challenge to maintain youthful idealism and sportsmanship; these will contribute immensely toward the solution of the problems likely to confront civilization during the next few generations.

# Utility Women Help*

## Should be trained in electrical housekeeping and understand the problems in the homes

By MISS SOPHIA MALICKI
*Chairman Women's Committee*

TO UTILITY women there appear to be two challenging conditions demanding a personnel thoroughly informed to meet them. These are (1) the lack of public understanding of utility structure and its operation, (2) the lack of knowledge as to what the services of utilities can do for the home. These conditions directed the choice of subjects of the committee program. Throughout the country utility women are studying economics of utilities and application of electricity to the household. Along with this they are preparing for and carrying out plans for diffusing the information to women outside of the industry.

A utility company should be the community household management center. It should answer the plea of housewives for a place to which they can turn for advice and assistance on problems of efficient management of the home. This should also be a laboratory for studying performance of equipment sold by the company and finding new uses for it. All women of a serving company should be as thoroughly trained in electrical housekeeping as possible, and through their knowledge should broaden and follow up the work of the home service members.

All committee units follow the plan of inviting representatives of women's organizations, schools and home makers to the educational meetings and receptions. This acquaintance is valuable to utility women because it brings to them recommendations for serving the customers better. It gives to the visiting women an understanding of the purposes of the organization and of the companies' sincere desire to satisfy their public. It is important that our women understand how to help the home makers of their communities; it is just as important that the home makers know our women can help them. Wives and relatives of utility employees have a large interest in the industry and are enthusiastic participants and contributors to successful committee work.

### PROBLEMS OF THE FARMER'S WIFE

The farm woman's problems are a large concern to utility women. Understanding full well the difficulties interfering with complete farm electrification, they want to bring these explanations to farm women and also to give to them an appreciation of what electricity will do on the farm. In one state the women's committee has arranged an organization including utility women, representatives of the Federation of Home Bureaus, home demonstration agents and members of home economics colleges to study means for the best co-operation between the farm women and those of the electrical industry.

Safety, a subject of universal importance, is followed in all educational and public work. Committees are giving resuscitation and first aid instructions to clubs, schools and young people's organizations. This study of safety practices qualifies committee members to participate in community safety programs. Units of safety councils find utility women valuable coworkers because of their understanding of the importance of safety education.

---

*Abstract of report presented at N.E.L.A. convention, Atlantic City, June 4-8, 1928.

### A Form of Social Service

Women's committee units in all localities are taking their proper part in civic and philanthropic activities. The opportunities for participation are many—health campaigns, baby weeks, invalid soldier, orphan and other programs. Public speaking is followed by committee members—not with the thought of intriguing audiences through their eloquence, but to present simply and directly the facts women are requesting. This is recognition of an obligation. Many of you last year heard Mrs. Baldwin, chairman of the living costs committee of the National League of Women Voters, say: "We have many questions which we want to ask you. We want to know the cost of production and distribution; we want to know about the regulation of utilities; we want to know the facts—to understand your problems."

And we should certainly fail in a duty if we did not make ourselves heard in places where improved home making is studied. The fact that women need to place a higher value on their energy and time brings a direct responsibility to the utilities for a liberal portion of education in standards of health and decency. Our services supersede the largest portion of drudgery in housekeeping, and ours the blame if so many women are still doing physically work for which machinery is developed. This is a social problem and ours is a fault chiefly of omission. We have not universally enough competent women to give the assistance to home makers they need.

Women appreciate and respect the responsibility placed on them of spending 80 per cent of the money going into retail trade. They are happy to learn that utilities are making every effort to put brains behind the counter and impart to them more information about what they are buying and using. This educational work is gaining for utility women their recognition by home makers as intelligent representatives of an industry deeply important to home making.

## SOME N.E.L.A. SERIAL REPORTS, 1927-1928

### Commercial

*Industrial Heating*

Carburizing in the Electric Furnace, No. 278-5.

Industrial Electric Heating Installations, No. 278-28.

Sales Plan for Developing Industrial Electric Heating Load for Electric Service Companies, No. 278-13.

*Lighting Service*

Lighting Service Manual Part II, No. 278-1.

*Power Committee*

Economic Utilization of Waste Wood, No. 278-18.

Serial Report Power Committee, No. 278-61.

*General Merchandising*

Trade Practice in Central-Station Merchandising, No. 278-9.

*Industrial Lighting*

Results of the Industrial Lighting Sales Campaigns, No. 278-19.

*Wiring*

Sell Additional Wiring, No. 278-35.

### Engineering

*Overhead Systems*

Service Tests of Treated and Untreated Poles, No. 278-3.

Mechanical and Electrical Properties of Conductors for 220-kv. Lines, No. 278-17.

*Meter*

Standardization of Terminal Chambers for Single-Phase and Polyphase Watt-Hour Meters, No. 278-16.

Auditing Meter Records, No. 278-23.

Educational Opportunities for the Meterman, No. 278-27.

Methods of Determining Correctness of Watt-Hour Meter Connections, No. 278-31.

A Method for Determining the Condition of Current Transformers While in Service, No. 278-40.

Totalizing Output of Two or More A. C. Circuits on One Watt-Hour Meter by Paralleling Secondaries of Current Transformers, No. 278-43.

*Hydraulic Power*

Waterwheel Testing and Operating Records of Plant Discharge, No. 278-34.

*Electrical Apparatus*

Automatic and Remotely Controlled Substations, No. 278-6.

Generating Station Bus and Switch Structure Design, No. 278-20.

A.-C. Substation Design Practice —1927, No. 278-39.

### Accounting

*Purchasing and Storeroom*

Standardization and Simplification of Stationery and Office Supplies, No. 278-29.

Linking the Material and Supplies Account on the General Books with the Physical Inventories, No. 278-30.

*Statistics*

N.E.L.A. Statistics, No. 278-62.

*Customers' Records*

Receiving, Recording and Refunding Customers' Deposits, No. 278-32.

*General Records*

Economic Utilization of the Payroll Department, No. 278-54.

*Fixed Capital*

Fixed Capital Records of Structures and Contract Construction, No. 278-60.

### Convention Reports

Educational Committee, No. 278-47.

Rural Electric Service Committee, No. 278-50.

Insurance Committee, No. 278-58.

Public Speaking Committee, No. 278-59.

Lamp Committee, No. 278-63.

Water-Power Development Committee, No. 278-66.

# Radio and the Power Industry*

Millions in revenue from alternating-current sets. Use in public relations. Engineering applications. Future uses outlined

By H. P. Davis
*Chairman Board of Directors, National Broadcasting Company*

*H. P. Davis*

THE radio industry has grown so fast that few, aside from those directly connected with it, have any idea of the rapidity with which it has developed. In order that we may obtain the correct perspective and thus see the possibilities, I am going to quote a few basic figures which have been gathered from sources which, I believe, are authentic. These data in one way or another have been frequently quoted—my justification in repeating them is the fact that their increasing significance renders them well worthy of repetition and consideration.

The radio industry, directly and indirectly, gives employment to more than 320,000 people, with approximately 30,000 manufacturers, agents and distributors engaged in the manufacture and sale of its products.

The sales of radio merchandise in the year 1920, prior to the start of KDKA, were less than two million dollars. Sales have grown from year to year, until in 1927 they were approximately five hundred million dollars. In seven years, therefore, a business in the neighborhood of two billion dollars has been created.

The total number of homes in the United States is approximately 28,000,000; there are about 10,000,000 homes with receiving sets, leaving about 18,000,000 homes without receiving sets. At present 694 broadcasting stations in the United States are entertaining the public; and it is estimated that there are about 40,000,000 broadcast listeners in the United States.

Here, within the range of a single voice, we have a potential audience of 40,000,000 people, and the number is constantly increasing. Such has been the increase in the radio industry in the United States. It has been the most remarkable achievement in the industrial history of the world, and should furnish a sufficient answer, if such is necessary, as to the permanence of radio.

Radio has become an indispensable element of modern life. No new service ever received such immediate response and favorable reaction from the public or was so instantly popularized.

During the past year there has been a wholly revolutionary change in the power supply for radio receiving sets. With the advent of successful alternating-current operated thermionic tubes, the battery filament supply is being rapidly superseded by these alternating-current devices, and the entire energy required for operation of a radio receiver may be obtained from the lighting circuit.

More than one hundred million radio tubes have been sold, and a conservative estimate would indicate that there are fifty million radio tubes now in daily operation, with the possibility that this number will be greatly increased within a short period.

Although at the present time only a part, possibly a third, of these radio tubes derive power directly from the lighting circuit, yet the number will rapidly increase. The receiving sets, of which these tubes are a part, draw current both day and night every day in the year, and it may be conservatively stated that the average requirement of current by each receiver is not less than eight kilowatt-hours per month. In a number of surveys that have been made by power companies and others, to determine the effect of this load, it has been found that the average radio set owner has increased his light bill from 25 per cent to 40 per cent, due wholly to the additional hours he uses the lighting service. This is no mean item of increased revenue available to lighting companies, due to the increase in power consumption by radio listeners.

It is my belief that this is only a beginning of a very considerable and valuable load, the amount of which is readily appreciated from the figures I have given. Furthermore, the number of receiving sets now in use and the possibilities of a great expansion in the number, all of which will eventually be electrified where such a service is available, must result in many millions of dollars

---

**Abstract of address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

a year additional revenue to the lighting companies.

The policy of the power companies with respect to the service they will render these radio customers is one that must receive serious and sympathetic consideration.

There remains then the question of how the power company may best utilize and develop radio broadcasting to further its public relations.

It is the key to millions of homes. It takes part in the family life and enjoys the intimacy of the family circle. These features make its employment one of great delicacy and fraught with danger if not handled with the best judgment and tact; for radio comes into the home as a guest and will be welcome or unwelcome exactly under the same rules of behavior as any other guest.

The use and development of radio broadcasting by the public utilities is a contribution they owe to the industry. already several of them have made evident their appreciation of this fact, and three different ways of using this facility are being developed:

First—Broadcasting station ownership and operation.

Second—The use of chain broadcasting station facilities.

Third—Local broadcasting.

From my experience in developing, maintaining and operating broadcasting facilities, I do not recommend the first. The growth of the sponsored program has largely extinguished any value of individual ownership in favor of the sponsored program.

In the case of the large, nationally developed public utilities, network facilities like those provided by the National Broadcasting Company are to be recommended.

For the local utilities, the medium is obviously the local broadcaster.

The offerings in all cases should be of the highest class in the entertainment features, coupled with carefully prepared information.

So much for the present. What does the future hold?

No one, ten years ago, would have envisaged the actualities of today; yet we, who are directly within the industry, I repeat, may presume to predict even better things. While our radio brings us only sound today, in our laboratories sight transmission is an accomplished fact. We call it Television, and it only remains now to reduce it to a practical form to make it available to the public. This will be another appliance one hundred per cent electric.

### TALKING "MOVIES" NEAR

Talking "movies" in the home is also just around the corner. At the start, this device will be actuated through the use of individual film records; later, as a service of the broadcasting station.

Apparatus is now developed in practical form whereby a message or a picture can be transmitted in facsimile form—in other words, as a typewritten page or picture. This is an entirely new and revolutionary system of telegraphic communication.

This agency opens up other avenues whose development can be most far-reaching. I conceive it possible, when combined with the principles of the Televox, to arrange a device for use as a broadcast receiver which can be started or stopped at will. This device will automatically take the message from the broadcasting station in facsimile form—in other words, as a printed communication. At one's leisure, he can go to his receiver and get the market reports, weather reports, important news items—in fact, through selective controls, any service would be available for which he may indicate a desire. Items of interest will be made available in the home or office immediately they occur, and thus furnish the means by which this information may be quickly and easily obtained.

Progress in this direction is inevitable; its future is assured.

---

# The Rate Situation Discussed*

### By EDWIN GRUHL

*Chairman Rate Research Committee*

*Edwin Gruhl*

NOTWITHSTANDING the outstanding success of the electric light and power industry in efficiently serving its public, and especially its achievements in anticipating requirements of its patrons, there has occurred during the past year much discussion in criticism of the industry and its rate policies. Coupled as these criticisms usually are with the belittling of regulation and the advocacy of municipal and government ownership, it is not surprising that the data upon which they are based do not withstand the scrutiny of critical analysis.

The rate research committee has issued reports for many years and therein has pointed out from time to time the policy of the industry toward rates—only, however, in so far as provided by the scope of the committee's activities. At no time has the committee ever expressed any opinion as to the reasonableness or unreasonableness of any rates *per se,* nor is it within its province to do so. It is not within its scope of activity to discuss the merits of private versus government ownership or the questions of policy involved therein. The work of the committee has dealt mainly with rate forms, types, methods of analysis, etc., and in its reports it has endeavored to point out advantages of the most suitable forms of rates which are beneficial both to the customer and the company and to comment on important events in rate matters occurring during the year, such as court and commission decisions, rate papers, results of special research, etc.

---

*Report presented at the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

The purpose of a price policy in any industry is to develop the maximum of business at a minimum of cost, a result of mutual interest to producer, merchant and customer. As has been pointed out in previous reports, that policy may be expected to vary according to the locality, its domestic and industrial requirements, its cost of providing service, its possibilities of increased development of the use of such service and other factors. But the ideal policy for time and place exists irrespective of the form of regulation or the character of ownership. The extraordinary development of the industry and its ability to reduce prices with such growth in business demonstrate that as a whole its rate policy has been sound.

Much of current criticism has been quite general and is thus difficult to answer specifically. The principal allegation seems to be that the rates in a specified community are too high compared with the rates in other specified localities. This charge, in fact, appears to underlie most of the criticism directed against the industry as a whole. In many cases the rates cited specifically are in error. In others, comparisons of rates are made as between different localities and as between different classes of customers, with no consideration given to the differing conditions and factors which in nearly all cases totally invalidate such comparisons. The usual method of making such a charge takes the form of selecting the lowest rate of a municipal plant as the criterion by which to compare all private-company rates, without any mention of the subsidy which often makes such low rates possible or of the rates of the other municipal plants which are materially higher.

> *The purpose of a price policy in any industry is to develop the maximum of business at a minimum of cost.*
>
> *It is believed that the industry has met the burden put upon it as a new and growing industry and has not only lowered its charges generally but that the service received by the consumer today is worth many times the value of that which he received but a few years ago.*

Attempts have also been made to create the general impression that more or less discrimination exists against the residence class in favor of the large power user. It has been claimed that generally the rate schedules are the haphazard results of charging "what the traffic will bear" and that there has been little or no attempt made to adjust rates on a scientific basis.

All of these charges have been widely broadcast throughout the country and have received limited comment in the press in certain sections. Occasion was taken in our last year's report to disclose the error of such comparisons and alleged facts appearing in a similar connection during the then current year. The analysis presented by your committee has not been refuted. Its report has been given wide circulation and is certainly familiar to all careful students of the principles of rate analysis. The continued repetition of erroneous statements under these conditions can be accounted for only as the result of misrepresentation or ignorance.

The report of your committee this year (which will be published later as a serial report) undertakes to disclose, for the benefit of member companies and all students of the rate situation of the industry, additional data and information in refutation of these general charges. While the material does not pretend to completeness, it is sufficiently indicative to demonstrate that many of the charges repeated against the industry constitute unwarranted and misleading propaganda.

Under the heading "Rate Comparisons" there will be found of particular interest comparisons of bills of municipal plants for domestic service with charges of communities served by corporations. These demonstrate that, if such cost comparisons are proper, the customers of a number of widely quoted municipal plants are not as fortunately situated as those served by public utility corporations under private ownership, and that for the group as a whole charges in reality for this class of service, concerning which there has been the most discussion, are lower than those by the municipal undertakings.

Two publications, "What Price Electricity in Our Homes," by Morris Llewllyn Cooke, and "Power Control," by Raushenbush and Laidler, have recently appeared. These have been analyzed by the committee and are commented upon in the forthcoming report. Study has also been made of the rate situation in Ontario, looking to the comparative trend of domestic, commercial and power rates, with the analysis disclosing that the classification is not, as frequently alleged, based upon cost of service to the class, but upon other considerations, the most important of which is that of political expediency, the domestic customers being favored at the expense of the commercial business. This is confirmed by the recent report of the commissioners of Toronto, which admits that domestic service in Toronto has been rendered at less than cost and announces increases in domestic rates effective in July.

The report also discloses in reveiw the significant decisions within the last year of courts and commissions, all of which appear to confirm previously established principles. Carl D. Jackson, legal advisor of the association, and John D. Van Wagoner, assistant, have continued their careful work as editors of *Rate Research.*

Especially informative will be found the bibliography on classification of service and analysis of costs. It will be seen that the industry has been well aware of these important factors since the earliest days of the central stations. It is believed that the industry has met the burden put upon it as a new and growing industry and has not only lowered its charges generally, but that the service received by the consumer today is worth many times the value of that which he received but a few years ago. The industry has endeavored to render approximate justice in its charges to its different classes of consumers, and, on the whole, it can confidently be asserted that this has been done.

# *Coffin Award for 1928*

GOES TO

# Puget Sound Power & Light Company

RURAL development, domestic load building through intensive sales effort and railway electrification are among the outstanding accomplishments that won for the Puget Sound Power & Light Company the 1928 Coffin award. In 1927 the company connected 3,700 farm customers, raising the total to 25,000 (63 per cent of the 40,000 farms). During the year 8,042 electric ranges were sold, establishing a record for the third consecutive year. The total number of range customers at the end of the year was 22,369, or a range to every 4½ residential customers. The average annual consumption per residential customer during 1927 was increased 113 kw.-hr., bringing the total to 763 kw.-hr. At the same time the number of domestic customers was increased 11 per cent. Two transcontinental railroad lines utilize Puget Sound power for operating their electrified sections.

Our Stock Is A Good Investment
Electricity will do for Agriculture what it has done for Industry

*Domestic and rural uses of electricity stimulated by appliance displays*

## *Some Puget Sound*

# Accomplishments

*Electric pumping that produced 100 bushels of wheat per acre*

### RURAL

Added 3,700 rural customers in 1927; serves 25,000 out of 40,000 farms.

Pioneered in electrifying brooders; reduced cost of orchard spraying; improved irrigation.

Virtually all of the $30,000,000 poultry industry in western Washington is electrified and 90 per cent receive service from the Puget Sound Company.

Developed many new farm uses for electricity.

### DOMESTIC

Established inducement rates.

Increased average domestic consumption 113 kw.-hr. in 1927.

Average is now 763 kw.-hr. despite 11 per cent increase in customers; average revenue $31.39.

Sold 8,042 electric ranges in 1927.

Total on lines is 22,369, or one for every 4½ domestic customers.

### RAILROADS

Aided electrification of Great Northern and Chicago-Milwaukee Railroads.

### GENERAL

Removed serious barrier to hydro development by hoisting fish over 293-ft. dam.

Increased gross revenue 14 per cent in 1927.

Increased domestic revenue 21.3 per cent in 1927.

Raised total domestic consumption 30.2 per cent in 1927.

# Allocation of Sales Costs*

### Merchandise Accounting Inadequate in Utility Business—Classes of Charges and Importance to Sales Efforts

By E. W. Lloyd
*Vice-President Commonwealth Edison Company*

*E. W. Lloyd*

VERY few central-station companies were in the merchandising business ten years ago, but recently the number has increased very rapidly, principally owing to the fact that the central-station companies are realizing the necessity of selling more kilowatt-hours to each customer and that the sale of electrical merchandise gives the greatest promise of bringing about this result.

The proper allocation of accounts covering the cost of the important subdivisions of these operations has not had very much consideration. The classification of accounts as it now exists is not sufficiently broad to cover what is required by the merchandising manager or the executive to provide a complete picture of the situation and enable him to know his exact costs. In many instances merchandising accounts have been combined with other accounts, and we frequently find the functions of a merchandising department carried on in part by other departments in the business without control or supervision by the merchandising or commercial manager. I ask you what private business could stand such a condition for even one year.

The central-station companies in most instances to date have seemed to overlook the necessity of selecting men who by inclination and training belong to the merchandising class, but have put in charge of their merchandising operations men of no general practical knowledge of the intracacies of the art of selling, with the almost foregone conclusion that they cannot succeed. Now I do not mean that this is the only reason that the central-station companies have been unable to merchandise at a profit. There are numerous other reasons, some of which I will mention—the lack of customers' acceptance of many electrical devices as a whole; many electrical devices are still in the early development stage of their existence; many of the functions performed by electrical devices can be accomplished by other utensils backed up by years of customer experience. There are still a few articles of merchandise, such as the flatiron, that have common use in the home, but a large majority of devices have not had common acceptance, so we are faced with the resistance of prejudice and unfamiliarity on the part of the ordinary "prospect." Another factor is the long life of ordinary electrical appliances. The customer buys an iron, toaster or percolator and frequently does not need another one for several years. In other words, the narrowness of the electrical line and the infrequent purchases of most devices usually sold in the merchandise shops of utility companies, dealers and other electrical stores are a distinct handicap in the attempt to make money by selling such merchandise without side lines. Without these, those who complain of us could not exist.

The reason the department, chain and hardware stores can and do undersell the central-station companies with the same line of merchandise is because they have a broad line of appeal in other forms of merchandise which bring the same customers into their stores frequently. As a consequence their overhead per unit of sales is very much lower. A notable example is the corner cigar store, which, in order to pay enormous rents, has added such articles as razor blades, lighters, clocks and many other things.

In many cases our stores have been loaded up with costs which do not properly belong against the store division of the central-station activity. Part of the rent costs charged to merchandising activities should be allocated against the electricity sales of the company, because the company in most instances is required to furnish reception and display rooms in which the public can transact the normal business of electricity supply, and at least part of the cost of these rooms should be properly charged against electricity sales rather than against merchandise sales.

#### Handicaps to Profit

Another handicap has been the charges for advertising. The insistent demands of public utility companies from every source for participation in every class of advertising known to trade are well known. The sale of goods by a merchandising company, with the necessity for showing a profit or going into bankruptcy, permits the use of only such advertising media as would bring profits to his business.

---

*Address, "Some Problems for the Accountants in Merchandise and News-Business Expense," before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

Another example of improper charges against merchandise activities has been in connection with that class of merchandise known in one case as experimental and in another as promotional—for instance, any devices using electricity which are strictly in the experimental stage and which, if the central-station company did not promote and push them, would never be developed. We have had many experiences in the past with such appliances. How many ruefully remember the difficulty of selling the early electric iron, the table lamp and the electric fan! The second instance is the promotional form of merchandising, where the device has been developed but has never had very common acceptance—for instance, heating and melting furnaces, commercial cooking and other industrial devices. The cost of persuading customers to use such devices is a way beyond the possible merchandising profit. The cost of selling such devices has no place in merchandising costs as applied to merchandise of common acceptance, such as is usually sold in larger quantities in electrical stores. Another cost which is frequently charged to merchandising effort is putting on a campaign for the sale of a particular kind or class of merchandise which in the last analysis would not be attempted if the company carried on any merchandise sales activities in the usual acceptance of the word—for instance, such campaigns as the placing of kitchen-window ventilating fans, kitchen lighting units, the replacement of old lighting fixtures in the home with new ones, the installation of wiring for more outlets in homes already wired, the development of new electrical devices to place the manufacturer in a position where he can make enough of them twelve months of the year to warrant him making a price the public will pay. We have not at all reached the stage where the manufacture of such devices is possible on a basis of production which will permit the making of a price that will encourage use. At the present time we are trying to encourage the manufacture of electric dish-washing machines, egg beaters, therapeutic devices, hair dryers, massage machines, insulated ovens, etc. It is hardly necessary to enumerate any more of such a line. It would not be difficult to enumerate dozens of them.

*In many cases our stores have been loaded up with costs which do not properly belong against the store division of the central-station industry.*

*I do not believe there is any excuse at this time for central-station companies selling common and accepted lines of electrical merchandise at a loss.*

*There are thousands of applications of heavy-duty appliances which will never be put in service if the central-station company does not do the pioneering job.*

*Any executive whose company is selling only 350 kw.-hr. a year per residential customer should be thoroughly ashamed of his position in the industry.*

What I am leading up to is this, the accountants in our business in developing adequate accounting systems should take into consideration the factors above enumerated; that the charges against simple merchandise that has had some customers' acceptance should be segregated from others entirely promotional or experimental in character; that they should give consideration to the proper allocation of certain costs for rent and other overhead costs which have a distinct relation to the sale of merchandise of common acceptance. Storeroom and transportation costs, rent, advertising, etc., should be scrutinized carefully to determine in what classification such charges belong.

The standard line of household utensils, all of which are on display and sale by the average electrical store and in the electrical section of department, chain and hardware stores—and which, by the way, were only a few years back in the experimental or development stage and scorned by those who are now complaining in some locations of some of our practices have in the last year or two been given considerable attention by half a dozen national organizations representing the department stores, hardware stores, drug stores, furniture stores, etc. Some complaints were being registered against central-station companies for selling goods at a loss. There are many angles to this problem, many of which these associations do not understand. They only know the merchandise referred to in a previous paragraph that has had sufficient customer acceptance to permit them to sell it on a par with other goods they sell at a price which will net them a profit provided the local central-station company does not adopt the practice of price cutting. We should in no event continue a practice of price cutting, but I do not believe the practice is so common as some people think. I believe, on the whole, the central-station industry is maintaining prices of merchandise on a fair basis. Our critics are not themselves free from criticism on this score. We can, particularly in the large cities, refer to the daily advertisements showing cut prices on many lines of electrical merchandise, in many instances much lower than the central-station company can sell them.

I do not believe there is any excuse at this time for central-station companies selling common lines of electrical merchandise at a loss except in specific cases where the device in question has not had sufficient acceptance to make it a common article of trade and where if the central-station company does not make some effort to place it in that position it will never get there. There are plenty of such articles being developed every year.

I think we should discourage the giving of premiums of various kinds, but I see no reason why we should not follow the accepted practice in the merchandising trade for the disposal of merchandise that does not move quickly. All merchandising concerns recognize this principle. They also look for leaders to attract people to their stores. When merchandise does not move quickly they see to it that it will, by cutting the price. It is standard accepted practice to carry on seasonal sales on a very wide line of goods at prices they advertise as being below the standard prices. Who is not familiar with the January linen, the August fur and the March furniture sales? Now, this suggestion that we cut prices does not mean that we should cut the price of merchandise of standard acceptance, but that we have the right to follow accepted practice in merchandise trade, such merchandise to be legitimately disposed of.

We note that department stores advertise a standard line of goods at cut prices where they are able to buy a job lot of a firm going out of business, to buy from a jobber or manufacturer caught with too much stock or to purchase a bankrupt stock. Why should we not do the same if the goods are right?

There is still another class of merchandise which must be given consideration, and that is the heavy electric appliance used in industry, which is not being promoted or sold by the manufacturers, manufacturers' agents or jobbers in sufficient quantities to make the common use of such devices possible. Some one has predicted that there will be just as much electricity used in the next generation for heat applications in industry as has been used in motors in the past generation. This may or may not be true, but the fact remains that there are thousands of applications of heavy-duty appliances which will never be put in service if the central-station company does not do the job or until such time as there are enough of these devices manufactured or demanded so that others may do the work of selling at a profit.

Another factor is the cost of servicing devices. All electrical devices require more or less service from time to time, and it is natural that the public call on the central-station company for such service, all of which is part of the cost of popularizing the device. Nevertheless, not all of this servicing cost should be charged to merchandising accounts as the central-station company enjoys revenue from the sale of electricity from the device for long periods of time and if the device is not in use the company in question is losing revenue because of this fact.

These are devices in the promotional stage which cannot in the first few years of their development carry a merchandise profit. As a recent example, let us recall the domestic refrigerating machine and in the recent past the washing machine, on which we and the manuafacturers have had to incur large losses in order to put such devices on a strictly merchandise basis. Some of them have not arrived yet. If the central-station companies had not placed themselves behind these and similar devices with money and service at their command, the department and hardware stores would not be able to sell them today. Who ever heard of a case where those now complaining furnished money to perfect any electrical device?

I am sure that if we went out of merchandising neither they nor the public would receive the benefit accruing when science, invention and the manufacturers are encouraged by the central stations, which help in placing in the hands of the public the labor-saving devices that are helping in such a large measure to place the American home on a higher plane and standard of living than ever before attained.

We are just entering an epoch of development of the industry which demands the sale of more kilowatt-hours, and the company whose executive familiarizes himself with the full merchandising problem and backs up his sales manager not only with money but with intelligent teamwork will reap the harvest of more energy sales in full measure.

In most of the cases coming to my attention the sales manager is not getting the assistance needed to do a big job, and it is a big job. Any executive whose company is selling only 350 kw.-hr. a year per residential customer should be thoroughly ashamed of his position in the industry, and he can only change it by intelligent rate structure plus fair merchandising intelligence and a forcefully backed-up sales effort. The accountant must not shirk his duty in this situation.

## *The Ten Cardinal Rules of Customer Ownership*

Prepared by the Customer Ownership Committee
of the National Electric Light Association

1. The sale of the securities must be direct from company to customer or through an agency expressly created for the purpose and controlled by the company.

2. The safety of the securities offered must be amply protected by property and earnings.

3. A minimum rate of dividends must be provided for in so far as honest judgment based on experience can foresee.

4. A reliable resale market must be maintained in some manner so that shareholders who wish to dispose of their holdings can do so promptly at nominal expense.

5. A partial-payment purchase plan must be operative in order to give every customer who can save a small amount monthly full opportunity to become a shareholder, and to encourage thrift.

6. The proprietary interest and responsibility of shareholders must be emphasized and the shareholders supplied regularly with information regarding their company and its affairs.

7. Loss of capital by shareholders in hazardous and fraudulent offerings from various sources must be guarded against by the rendering of authentic information and advice to shareholders.

8. The number of shareholders must be increased steadily, and efforts should be made to avoid large individual accumulations of stock.

9. Employees must be carefully instructed in order that all representations made to customers or others shall be in line with the facts.

10. Managements must realize that customer ownership multiplies their obligations to the public and intensifies the trust reposed in them. It does not replace the constant striving for higher efficiency, good service, reasonable rates, courtesy and progressive public relations policies.

# Importance of Accounting*

### Complexities of the accountant's work have grown greatly, but the standard of personnel has not kept pace with the increased requirements. Machines in accounting

### By E. A. Davis

*Chairman Accounting National Section*

WE ARE passing through an interesting period in the development of this country—probably, from the phases of both government and business, one of the most interesting in the country's history. This is not the time or place to theorize on the tendencies in either phase nor on their possible consequences. One of the byproducts of the governmental phase has been an increased, though temporary, burden thrown upon the accountants of most of the companies. This condition made itself manifest during the past year and in all likelihood will continue well into the next administrative year. Probably no other section of the association is faced with this same condition. It must not be allowed to act as a retardant influence upon the forward movement of this section, and it appears unusually desirable that the work for the year be got under way with dispatch. Those of you present who are responsible for the work of the geographical divisions should bear this in mind and apply yourselves diligently to the task before you. It will be several weeks before the new organization for the national section can be perfected and functioning. In many of the geographic divisions a great deal can be accomplished before that time, and to you present who will be carrying on the work in such divisions I bespeak for the new administration earnest co-operation in this direction.

*E. A. Davis*

As a means of assisting the new administration in getting the committee work under way with the minimum of delay I obtained from each of the national committee chairmen a review of the year's work of his committee, together with his recommendations as to next year's procedure. Interesting among the comments received was a statement calling attention to the tendency of the committees to ease off on their work in the early months of the calendar year. This is no doubt due to the habits of old continuing, habits created under the old plan of publishing all committee reports for distribution at the annual convention with a dead line for the receipt of copy set at approximately March 1. That condition no longer exists. Reports may be printed at any time under the present plan, and there is no reason for a committee's activities not continuing up to the time the annual convention assembles.

We dwell quite extensively in our meetings and in our reports upon accounting problems and procedure and very little, if at all, upon the personnel problem as it is found in the average accounting department. Those of us whose experience covers no more than fifteen years have seen the complexities of the work being done in this department increase tremendously. Pension plans, savings plans, federal taxes, incentive wage scales, transmission lines are but a few of the contributory causes and do not take into account problems occasioned by rapid growth. In addition, we have seen the requirements of the other departments and of the executives become much more exacting in the character and quality of the information provided by the accounting department. Justifiably so. Despite all this, I seriously question if the average personnel standard has been raised to any marked degree. The reason for this is probably not difficult to discover. It is unfortunately true that too frequently economy waves pound hardest on the accountants and their departments. But the accountant who practices economy to the extent of depriving himself of the right kind of assistants and timber for promoting through succession is likely to prove extravagant.

Furthermore, the complexities and the decidedly specialized nature of the accounting work in this industry make it more essential than in any other industry that there shall be competent assistants developing in the accounting departments. As a rule the responsibility for their selec-

tion rests upon the accountants and it is not a responsibility that should be taken lightly.

It is entirely within the realm of possibilities that business conditions of tomorrow will require more than heretofore company executives whose basic training has been along economic lines. Careful selection of assistants today might provide the needed executives of tomorrow. A carefully selected personnel is but the beginning, however. Their subsequent training and development is of equal importance and is a serious responsibility of the accountants. As an aid in this development I do not believe it is necessary for me to point out to this gathering the practical advantages afforded by permitting active participation of the assistants in the work of this section.

### Machines in Accounting

That we are living in a machine age is just as true of offices as it is of factories or of homes. The opportunity for doing more work and better work by the use of mechanical devices exists in the offices as it does elsewhere. The reports of the Accounting Section have not up to the present time dealt extensively with the application of such devices. The types available are many and various. None of them is made to meet the requirements of public utility offices exclusively. Some of them are better adapted for one class of work while others will excel in another class. The amount of information available as to the types of devices best adapted to the various accounting operations in a public utility office is meager and, as a rule, the product and concept of the manufacturer. Certain difficulties have heretofore existed which have tended to discourage any attempts by committees of this section to issue reports dealing primarly with these mechanical office devices. It is believed that the way has been paved this year for the removal of these difficulties so that the Accounting Section can by means of committee reports or some other manner make available to the member companies authentic information on such office equipment—information derived from its practical operation in public utility offices.

## Progress on Standardized Accounting*

By H. C. Hasbrouck

THERE are 39 regulatory commissions having jurisdiction over the accounting practices of electric light and power companies, including 38 state bodies and the commission of the District of Columbia. Twenty-eight of the 39 have adopted the standard classification recommended by the National Association of Railroad and Utilities Commissioners and formally adopted by the National Electric Light Association. The accountants of four other state commissions are now giving serious consideration to the adoption of the standard classification.

The standard form of annual report has been less generally adopted, principally, it would appear, because the state commissions require more statistical data than the standard form of report contains.

---

**Abstract of report of committee on classification of accounts, presented at N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

Decisions on questions of interpretation which have been passed upon by the committee in prior years are on file at National Electric Light Association headquarters, but still await editing for publication. This task, we hope, will be completed by the work of next year's committee.

The committee has gone definitely on record as believing that no changes in the standard classification should be recommended this year, but this does not prevent it from giving consideration to certain modifications which have been suggested and which undoubtedly merit discussion. Some of these it has before it at the present time, but it is not prepared to make definite recommendations thereon.

Among other matters for which this must be offered as in the nature of a progress report are the co-operation with the Commercial Section in an effort to obtain a uniform system of merchandise and jobbing accounting, which at present awaits the initiative of the Commercial Section, and the study of the accounting problems involved in interconnection agreements. This last subject was referred to the committee by resolution of the executive committee of the Accounting Section last February. It has been laid before all members of the committee, but evidently requires careful consideration, in view of its importance and comparative novelty. It can probably be best handled in a serial report by next year's committee.

---

# Railway Electrification*

### Illinois Central electrification described. Why power was purchased. Future of electrification outlined. Interrelation of the railroad and utility industries

By L. A. Downs

*President Illinois Central Railroad*

IN CARRYING out the electrification project in a manner to provide for the inevitable future growth of Illinois Central freight, passenger and suburban business at Chicago and assure the maximum efficiency in terminal operations, the Illinois Central is practically reconstructing its entire Chicago terminal. The electrification itself is being undertaken by stages. First is the electrification of the suburban service; that stage was completed in August, 1926, six months ahead of the time agreed upon. Next will come the electrification of freight operations, and later the electrification of through passenger operation.

When the electrification is completed it will cover 420 miles of freight, passenger and suburban tracks. In addition to the electrification itself, the whole Chicago terminal improvement project includes: Elimination of both highway and railway grade crossings on the main line for a distance of 38 miles south of the Chicago River; relocation of nearly all tracks in the Chicago terminal area; the movement of approximately ten million cubic yards of earth; construction of an immense gravity freight classification yard on the outskirts of the city; construction of extensive shop facilities; relocation and construction of freight and passenger car yards; construction of bridges, tunnels and subways; erection and reconstruction of suburban stations and platforms; erection of a through passenger terminal at the south end of Grant Park; construction of 250 miles of new trackage; construction of several miles of retaining walls and the reconstruction of the signal and interlocking system.

*L. A. Downs*

Some of these improvements were not essential to the electrification and could have been deferred until later, but it would have been more difficult and costlier to carry them out after electrification. The elevation and depression of tracks for the elimination of grade crossings, for example, was far more economical under steam operation than it would have been after the overhead supports were erected and transmission wires were in place on fixed bridges. A permanent track plan was worked out which will reduce to the minimum the possibility of having to shift tracks after electrification.

---

*Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

The electric suburban service covers a zone embracing 37.8 route miles and 127 miles of trackage. In the electrification of this service it was necessary to erect more than 900 catenary structures and to string approximately 293 miles of transmission wires and and 470 miles of messenger and contact wires. The 1,500-volt direct-current system with overhead contacts is used.

The electric service was begun with new equipment throughout. The cars, specially designed for this service, are of all-metal vestibule construction, each having a seating capacity of eighty-four. Spaciousness, cleanliness, good ventilation, uniform heating and ample lighting are among their notable features. The trains are operated in multiple units of two cars—a motor car and a trailer semi-permanently connected—and four-car and six-car trains are most numerous, although station facilities have been designed to accommodate eight and ten-car trains where required. At present 260 cars, having an aggregate seating capacity of approximately 22,000 persons at one time, are in use, and these cars are carrying approximately 120,000 passengers every weekday.

Aside from equipment, the most important factor entering into the electrification of the suburban service of the Illinois Central System was the choice of power supply. The practicability of constructing an independent power system, including generating plants, transmission lines and substations, for the sole use of the railroad was carefully considered, but the decision was against doing so and in favor of purchasing all electrical energy, under contract, from the Commonwealth Edison Company. Under this arrangement the Commonwealth Edison Company erected its own substations at designated points on the right-of-way, and it now supplies direct current to the traction system and alternating current, of suitable characteristics, for signal, light and other auxiliary uses.

### Reasons for Plan

I believe you will be interested in an outline of the reasons which led us to adopt this plan. The erection of an independent power system would have involved a heavy investment on the part of the Illinois Central, and the high cost of generation in such a plant, by reason of the necessity for a relatively high percentage of reserve generating capacity and on account of the comparatively small peak-load demand, would have made the operation inherently less economical than the purchase of energy from a large and highly organized power system. Furthermore, the ownership and operation of such a plant would have carried the railroad out of its sphere into the highly specialized field of power production, a field in which it might have been difficult for the railroad to keep itself up to date. Moreover, uninterrupted service must be maintained. Any breakdown of electric supply in such a busy terminal would be highly disastrous. The purchase of energy from a large power system having an ample generating reserve and duplicate transmission lines assures the Illinois Central of a dependable, uninterrupted supply of energy.

In its physical characteristics the electric suburban service represents a vast improvement over the steam service which it replaced. The widespread public approval that has been given this service is evidenced by the fact that the present volume of suburban patronage is already more than one-third greater than immediately prior to electrification in 1926. The increase in patronage has been so much greater than was anticipated that we have already found it necessary to place orders for twenty additional cars for early delivery. Because the running time of trains has been reduced between 11 and 28 per cent, electrification has increased the desirability of outlying communities by bringing them all within closer reach of the central business district.

I have already referred to the fact that under steam operation the Illinois Central suburban service was an unprofitable enterprise. It not only was failing to pay a return upon the investment in suburban facilities and equipment but the revenues were not sufficient to meet out-of-pocket expenses. By reason of the greater economy of operation and the increased patronage which followed electrification, in addition to an increase in rates which shortly preceded it, these out-of-pocket losses have been entirely wiped out, and the service is now producing considerably more than enough revenue to pay operating expenses and taxes. Although the present net income is still substantially short of a fair return on merely the outright cost of the suburban electrification itself, including the $10,000,000 worth of equipment purchased, there is ground for hope that with the continued growth of patronage the time will eventually come when the suburban service will be fully self-supporting, including a moderate return upon the whole investment.

One of the potential byproducts of railway electrification in the larger cities is the development of air rights. The development of such rights at New York demonstrates the possibilities in this direction at Chicago. The Illinois Central owns 65 acres of valuable property adjacent to the Loop business district in Chicago which will be available for air rights development as a result of the electrification of the terminal. It will be many years before these air rights can be fully developed, but they will be of large importance in estimating the eventual results of electrification.

Because of the prominence of our electrification program—the publicity it has received and the discussion it has caused—I am often asked for an opinion concerning the future of railway electrification. I am not given to prophecies, but I think there is no doubt that utilization of electric energy will continue to increase as special problems in railway capacity and operation are encountered.

### Influences Upon Electrification

As I see it, there are two elements which will have important influences upon the future development of railway electrification. The first of these is the development in the art of applying electricity to the problems of railway operation. Thus far it can hardly be said that railway electrification has passed out of the experimental stage. It has not been standardized to the extent of steam railway design. Each project that is undertaken is a new experiment in that it deals with a special problem, all phases of which have not been developed heretofore. I regard our own electrification as such a project. I have faith that the results we shall finally accomplish will fully compensate us for the expense we incurred, but when costly undertakings are being considered without the necessity which forced the Illinois Central into its electrification program it takes more than faith to justify the large expenditure involved. Engineers must know in advance that the results will be sufficient to pay a full return upon the investment, and they must be able to marshal the facts to support that knowledge.

If you are desirous of hastening the utilization of electricity in the solution of railway problems, there is scarcely any service you can render of greater importance than that which looks toward the development and standardization of the art of producing electrical energy and its application to steam railway operation. I do not mean that all types of electrification should be alike, for there are many problems, but I do mean that the art shall be reduced to such generally applicable terms that a railway engineer can know that under certain definite conditions certain definite results will be produced.

The other important element influencing the future development of railway electrification is the financial element. After it is proved that money can be saved by spending money for electrification, there is still the problem of where to get the money to spend. Every railroad in the country has plans for large engineering projects of demonstrable money-saving value that must be deferred from year to year because the money is not readily available with which to carry them through.

Here, too, but in another way, you can make a real contribution not only to the progress of railway electrification but also to the continued improvement of railway service and the increased economy of railway operation.

A simple illustration will show the results of the constant pressure for reduced rates. On the Illinois Central System our average revenue for hauling a ton of freight one mile was reduced from 9.66 mills in 1921 to 8.86 mills in 1927. Now, this reduction of eight-tenths of 1 mill per ton mile may seem to be a small item, but when it is applied to the 16⅓ billion ton-miles of revenue freight handled by the Illinois Central System last year, it amounts to more than $13,000,000, and $13,000,000 is 6 per cent on approximately $216,000,000. I am not going to say that this missing $216,000,000 worth of potential investment would have been made in electrification if we had had it at our command, but you can see for yourselves how much better disposed toward electrification a railroad with $216,000,000 extra of investment power would be than a railroad that lacked such an amount.

The constant downward adjustment of rates threatens to undermine railway credit. Credit is dependent upon adequate rates. If the railroads are to improve their properties and increase the capacity of their plants in keeping with the ever-increasing demands which are being made upon them, they must be allowed to earn returns that will attract the needed capital.

The electrical industries and the railroads have much in common. Both are engaged in providing for the masses of our population services of the most essential nature which have contributed greatly to the effectiveness of human endeavor. Both face large and important problems arising out of their common necessity for increased production, greater economy and equitable regulation. Finally, the buyer-and-seller relationship between them has grown to large proportions as the railroads have come to make greater use of electricity for light and power and the expanding electrical industries have made greater use of the transportation service which is the product of railway operation.

Both industries have felt the blighting effect of misguided public opinion in the past. Both have been the targets for hostile legislation and restrictive legislation. Both have consciously and earnestly sought to improve their relations with the public. There is no question in my mind that a great deal has been accomplished in this direction in the last decade. This accomplishment is reflected in the friendly attitude that now prevails generally in the public mind toward these industries and in the increased tendency on the part of law-making and regulating bodies to give them both a square deal.

I have been impressed by the excellent work which the National Electrical Light Association and the various electrical companies have been doing in recent years toward bringing about a better public understanding of their problems. There is no question that the whole electrical industry has been vastly benefited by this work. I believe it has had a beneficial effect upon corporations generally. On the other hand, the efforts of the railroads along similar lines have probably benefited your industry in like manner. Such efforts are cumulative in their effect. Their full benefits will not be felt for years to come. It takes time to efface the long-standing prejudices of the past and to bring the public mind, long given to mistrust of corporations, into a sympathetic understanding of their problems.

Confidence and co-operation cannot be built on any other basis than that of mutual understanding, and such understanding can be obtained only with the constant interchange of trustworthy information and intelligent discussion. The public is fair when it knows the facts and understands them. To me it is unthinkable that the frank, open, straightforward course which has increasingly marked the conduct of business affairs in recent years shall be abandoned.

# Lighting Service Committee Work*

By J. Daniels, *Chairman*

It is now recognized that the central-station lighting service department has its own peculiarities which are not shared by other branches of the industry. It has, therefore, been found desirable to hold closed meetings from which all manufacturers' representatives are excluded. The merits of various equipment or methods of lighting practice may then be freely discussed without offense to outside interests. Such meetings are naturally designed to further the central station's interests, but have incidentally benefited the entire industry by calling the attention of manufacturers or outside interests to any practice considered commendable or otherwise.

It must always be borne in mind that the central-station engineer is concerned first and last with the effect upon the ultimate consumer. Each customer looks to him for an expert and unbiased engineering service, free from the influence of sales or commercial propaganda.

The committee has other work well under way which will have an important effect upon lighting practice. The sub-committee on specifications for testing commercial glassware has prepared a standard method of selecting, testing and rating lighting equipment. All equipment recommended by a central-station lighting specialist in the future must come up to definite standards. Such a practice is obviously as advantageous to the reliable manufacturer as to the ultimate consumer. The elimination of sub-standard materials from the market is an excellent thing for the electrical industry—it should be aggressively promoted in every line.

# Call to Arms in Sales Work*

### Chairman J. E. Davidson outlines work of Commercial National Section and appeals for action on market development. Need for more sales and less market study

J. E. Davidson

THE time calls for action along the entire sales front of the whole electrical industry. This is the most important message that any man could bring from the Commercial Section. It is not only a question of the opportunity, which is vast, but of necessity as real as it is pressing. It is not a question of preparedness. It is not one of plan. It is not one of internal betterment, important as that problem is. It is whether or not we are to meet the supremacy challenge of the other great industries.

I know of no industry which has engaged in more numerous or more intensive association activities than has our own. Through the National Electric Light Association, National Electrical Manufacturers' Association and the Society for Electrical Development we have moved energetically to put our house in order, commercially speaking. While it would be premature to say that such task has been accomplished, I do not hesitate to suggest that enough has been done to justify shifting the emphasis of our strategy to the consumer selling front.

Let us for the moment turn our attention from ourselves and look to our markets. Let us measure the pace at which we are moving by the pace of other industries. Let us question the adequacy of what we are doing—the utter inexcusableness of not doing more. There can be no question of the fact that the strides of others prove our pace is too slow. In many respects our market is growing faster than we are. I do not mean to criticise the sales efforts of individual companies nor of individual groups. Splendid individual sales and advertising campaigns are being carried on. Columns are being thrown forward, well ahead of the line of battle. But collectively we are not engaged in that unified and coherent action which alone holds out the promise and the hope of those victorious results to which we are fairly entitled.

In the meantime other producers are eagerly availing themselves of opportunities which are equally ours. I will not burden you with a repetition of the data which have been accumulated through our surveys. Many of you are familiar with the basic facts, which can be boiled down to the statement that not by any means are our endeavors getting the share of the consumer's dollar which is our just due.

The keenest competition of all is not among individual manufacturers, but among industrial units. It is academic to tell you that in our fight for sales we are competing with the automobile industry and the whole roster of great industries among which the consumer distributes his purchases. Why is it that we are not making greater headway? There are numerous answers. But I venture one which few will challenge.

It is a fact that as an industry we have not organized for a powerful and sustained advertising and sales promotion drive to impregnate the entire consuming public with what we call "electrical consciousness." We need this drive, gentlemen. We need it to enhance the pulling power of our product advertising, to sell the idea of these products in advance or in conjunction with our efforts to sell the products themselves. Without it we are depriving our individual and group activities of the free and effective play we all desire.

After two years of close observation and participation in the work allotted to the Commercial Section, I do feel that definite progress has been made toward our objective. A year ago we were far from satisfied. Even now we are far from content. But I have high hopes that another six months will see the fulfillment of our wishes definitely under way. The time is ripe. The need for action is pressing. There has been much discussion. Essential information has been gathered and analyzed. The ground is well prepared. This is the moment to strike—and vigorously.

Primarily, I suppose, we are all thinking selfishly, which perhaps is well enough if we combine constructive action with thought. But there is a great deal more than that beyond our commercial goal. We have come to realize that public utilities are merely the trustees of electric service. It is our duty to give the public every opportunity to secure the comforts and the benefits of more varied electric service.

We have been so occupied with our individual problems that we have been content to accept business as it came to us. It is true that we have aggressively pushed our respective lines—thinking solely in terms of electric refrigeration, electric irons, toasters and other like appliances. But we have not faced the whole broad canvass of the possibilities of electrical development. Why exult to the country and to ourselves over the wonderful advancement which electric service has brought about? Instead we should point out to every American home owner the fact that we and they are merely on the threshold of almost undreamed-of advances.

---

*Abstract of report presented at the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

In fact, I should like to propose that our rallying cry should be "More kilowatt-hours per capita!" To accomplish this, however, kilowatt-hours must be definitely sold. Hence our aim in merchandising must be to create a real longing for more electrical appliances and to place the appliances in the hands of our potential customers and by intelligent educational methods make sure that they are used.

The "resident kilowatt-hour contest" which has been launched by the general merchandising committee has furnished every member company an excellent barrage for intensifying interest in selling more electrical energy. The purpose of this contest is to promote the sale of one more kilowatt-hour per home per day. Figure experts can see the importance of this movement, for, if the millennium could be reached and every home in the country were induced to use one more kilowatt-hour per day, our electrical energy consumption would increase about six billion kilowatt-hours, bringing in an increased revenue of about $300,000,000. While such a millennium may not immediately come about, without question this contest, if it shall have enthusiastic local support, will do a great deal toward increasing our sales of electrical energy.

### Need Co-operative Help

While our part in this program is clear, we cannot rely solely upon our own efforts. We must influence and win the enthusiastic aid of those who can and who logically should back us up. Among them are the retailers who handle, or are in a position to advocate, the purchase and use of good electrical appliances. Architects and builders can render invaluable service. Nor have we pushed electrical advertising—signs, window displays, floodlighting and allied opportunities for the greatest possible consumption of electrical energy. Until now we have left these important matters to the individual initiative of electrical manufacturers and electric light and power companies.

But the cities and smaller towns are by no means our only field for broadening our market. The farm and rural districts present a marvelous opportunity for concentrated effort. Agriculture can be taught to profit by electric motorization just as manufacture has learned its value. While economic conditions in some sections present obstacles, this should not prevent our pioneering in these communities in our work of education. Profits are, of course, desirable but should not be our sole aim. The winning of new friends and a nation-wide, non-sectional good will is of equal and vital importance. Worthy electrical appliances in the nation's homes will cause more word-of-mouth comment and result in more friendly feeling than all the pamphlets ever printed and all the speeches ever made. But first these appliances must be introduced into homes.

To accomplish these things there must be a concerted drive to sell not only appliances but electrical ideas. This is sound business and even sounder public policy. Plans aimed at such end have justified themselves. Power companies have done remarkably well in their urging of the wiring of old and new homes. The need for appliances thus created has been as effectively filled as created. But the surface has barely been scratched. No industry is further from the saturation point than our own.

It is an established fact that 37 per cent of the homes in America are not as yet even wired for electricity. Until they are their doors are closed to us. Even such homes as are wired are still pitifully lacking in the domestic electrical appliances that they might readily and advantageously possess. What are we going to do about it? We have had numbers of local campaigns and occasional national propaganda. During the past year successful schools have been conducted by the electric advertising, industrial heating and commercial cooking committees; splendid work has been done by the refrigeration, domestic electric range, wiring, general merchandising, lighting, transportation, customer relations, street and highway lighting and our other committees.

Practically every patron of these splendid concerns is a logical customer for us. Yet what is the fact? We get a much lower proportion of the public's expenditures than almost any other business. Far less essential businesses are more progressive than the electrical industry. Shall we tamely submit to this? The moment for decision is here. But it must not be a haphazard movement to which we commit ourselves. Whatever large-scale campaign we determine to enter upon must be backed up by special sales promotion material, thoughtfully prepared for the requirements of our individual groups. There must be a close-knit sales-promotion organization in every state and district—a close liaison between our field men and our headquarters activities to energize, facilitate and dovetail every move we make.

## Electric Range Committee*

By A. B. Collins, *Chairman*

USUALLY when a new and revolutionary product is announced it meets with overnight acceptance, and this has been true nationally in the case of radio and electric refrigeration.

However, this was not true of the electric range. While its fundamental value was early recognized, its practical application throughout the country was not immediate and the electric range has been required to go through a long period of pioneer development.

Previous range committees have devoted their efforts primarily to research and their findings, which have been published from time to time in the past few years, have enabled this year's committee to put, as it were, the stamp of approval of the industry upon electric cookery.

Therefore, the domestic electric range committee is privileged to present to the industry "The Plan to Sell Electric Cookery."

This comprehensive plan has been developed by the committee in collaboration with the National Electrical Manufacturers' Association and the Society for Electrical Development.

This plan book has been made possible by the many years' work of previous committees and it may be said to represent and express the ideas of those who have participated in the pioneering and development activities.

*Report presented at the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

# Interconnection

## *and Its Benefits**

Some fallacies discussed. Types of interconnection. Publicity values measured. Cases of interconnection benefits cited

By George N. Tidd
*President American Gas & Electric Company*

*George N. Tidd*

WHAT is interconnection? The New Century Dictionary says: "Interconnection is the state or condition of being interconnected." Well, that is like defining salt by saying it is NaCl. But it doesn't explain it. Let us try another angle. Perhaps by examining the objects sought and the results actually attained by interconnection we can arrive at the one fundamental and, having attained it, keep it before us as a guide so as to gage the desirability or undesirability of a particular interconnection by its adherence or deviation from the fundamental object or purpose. But first it may be desirable to explode some notions and ideas and explain what interconnection is not.

### Fallacies Regarding Interconnection

What is interconnection? What are the objects and purposes sought by interconnection? Does interconnection mean long-distance transmission of power? Does it mean superpower? Is it the same as its Marxian twin, giant power? Will it of itself bring about that sought-after millennium—the electrification of every farm?

The answer to the last four of these questions is emphatically no. Interconnection has nothing to do with long-distance transmission. The development of the art of long-distance transmission may make possible interconnections that were not feasible before, but long-distance transmission is certainly not the *sine qua non* of interconnection. Nor does interconnection aided by long-distance transmission mean the abandonment of steam generating plants—which will, of course, always be the main source of power—at the local centers, concentrating them all at the mine mouths and transmitting electrical energy from there hundreds of miles to the load. Leaving aside the obstacles to such a procedure due to the lack of necessary cooling water at most coal mines and to the comparative unreliability of transmission, we are still confronted with an almost insurmountable barrier. This is the fact that for any long distance, say one considerably in excess of 100 miles, the cheapest way of transmitting coal-generated kilowatt-hours is in freight cars and in the original state.

Interconnection—or, rather, one form of it—has made superpower possible, but, again, fundamentally, they are independent. Some of the finest examples of perfect interconnections have been recorded between systems that each had only a few thousands in kilowatt capacity—in fact, before superpower was "invented."

Will interconnection solve the problem of electrifying the farm? It will help, certainly. It will make, has already made, possible the extension of rural lines in many sections that would not otherwise be within reach of a power supply, but fundamentally the rural electrification problem is a distribution problem. Traced down, it becomes a problem of finding sufficient users for electrical energy on the farm to make the consumption in the individual installation sufficiently high to bring down the fixed charges of the distribution system to the point where the farmer can afford and is willing to use it. This is a problem not only for utilities but also for the farmers, for the various agricultural colleges and agricultural experimental stations. But interconnection alone cannot solve it.

We again come to the question, what is interconnection? Before we proceed with this let me make a distinction between two types of interconnections. I believe that in a discussion of the situation there is a real gain in dividing interconnection into two classes.

### Centralized Production Interconnection

The first type of interconnection had for its object the tying together of many small and scattered plants and the connection of such a network to a single efficient generating station or to a group of them. It is in the development of this type that the holding companies did such pioneering and lasting service. The object here was the substitution of a single and efficient generating source for the many scattered and isolated plants, or briefly the centralization of generation. The benefits to the holding companies of such a move have been pointed out many times before. But it has not been pointed out often enough that only by such centralized generation has it been possible to give the small city, town and village electrical service of the same high standards and at rates equal to those obtaining in the very largest communities. As the size of electric turbines and of stations grew the distance to which it was necessary to reach in order to get together enough load to load a centralized plant increased. The size of turbines and plants had of necessity to be increased because in such increase lay the only hope of cutting costs that were mounting in other sections. This led to interconnection of groups of communities that had in turn been previously interconnected. Carried far enough, this has sometimes been called superpower.

---

*Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

It is to be noted, though, that when groups began to be interconnected some of the advantages that were obtained previously in the tying together of small communities were no longer obtainable. For example, one of the things that disappeared, and very quickly, was the saving due to diversity. Thus, to take a typical case on our own system, on a system peak of 490,000 kw. our diversity between the four major groups was only 15,000 kw., or 3 per cent. This you realize is not very much of a diversity. In general, the same condition will obtain in other systems unless other factors besides geographical extent are brought in, such as the tying together of different types of load—namely, the industrial load and the lighting load—or factors such as a difference in time between systems, or others of the same type. But, broadly, this phenomenon reduces itself finally to one of centralized production similar to the integration that has been going on in other industries. That is the idea some of us had in mind twenty or so years ago. We thought of centralized production as the only means of keeping our heads above water. But, of course, that was before interconnection was discovered.

### Interconnection for Mutual Aid

The second type of interconnection, which was developed much later, was generally between systems that were normally completely independent and had an entirely different group of objects in view. Many of these objects have been gone into extensively before. To touch on them lightly here. They are the possibility of staggering construction between independent companies with the elimination of the economic waste that goes with building too far in advance of the load (and yet if construction is to be done economically, it generally has to be done in units larger than the immediate load in most cases justified); the possibility of fuel saving by utilizing during certain periods the more efficient of the plants; the possibility of reducing the reserve or standby capacity, and particularly the possibility of utilization of hydro, and, finally, the possibility of mutual aid in times of emergency.

All of the above, with the exception of the last two, have been gone into many times before the association and elsewhere. In the case of the utilization of the hydro facilities, however, interconnection can particularly claim this as one of its definite accomplishments, since it is only through extensive interconnected systems that this has been made possible. To cite a specific example: In one case where we have a hydro capacity of approximately 20,000 kw. distributed among four stations, it has been found necessary on Saturday afternoons and Sundays to transmit a portion of this capacity into a network extending over a distance of more than 320 miles from the source in order to utilize fully even such a small capacity; but the result of such an interconnection was fully shown in the kilowatt-hour output of this little hydro system. For a number of years before it was interconnected it averaged only around 76,000,000 kw.-hr. per year, but when the interconnection was completed the annual production went up to about 105,000,000 kw.-hr., a net increase of 38 per cent. The result of this increase is, of course, a saving of natural resources. The other object and accomplishment of interconnection—mutual aid—has, it appears to me, been almost altogether neglected, and not only has it failed to receive the proper amount of publicity, but very often the publicity that was given to it gave the wrong viewpoint and the wrong conclusion to the average man who read in the newspapers what was being done by interconnection and what its direction and aim were.

### Mutual Aid Paramount

It seems to me that, after considering all the benefits that are possible to the systems making an interconnection—and we are talking now of independent systems each one of which is in the position of being able substantially to carry its own load—and to the public, the combined weight of all of them will generally be less than the weight of the possibility of rendering mutual aid. Time and again I have had analyses of possible interconnections brought to me, made on a strict engineering basis, where apparently sufficient benefits, particularly benefits from a dollar and cents viewpoint, were not evident to justify the expenditures involved to make the interconnection, and I have had to take the burden of deciding whether or not the interconnection was to be carried through. In almost every case of that type the decision has been to make the interconnection on broad general principles, and again in almost every case subsequent operation has more than justified the decision.

It is possible for a utility so to design and build its system that it will be able to take care of every contingency—possible, but hardly justifiable. For if the system is to be built to withstand emergencies that cannot be foreseen, we enter into a period of guessing how far to go in providing for contingencies. We may take, for example, in the case of a power house or a substation, the highest level of flood water recorded and design our station to be safe against that, but to be really safe we ought to take into account the possibility that the previous high-water mark may be exceeded. Such occurrences are by no means rare. In doing that, if we want to be safe, we enter, as stated above, into a period of guessing, and such guessing continued throughout the entire system will open the floodgates of expenditures that would just as surely engulf us as would the physical water from the floodgates of heaven. We have a choice, therefore, between two methods of drowning.

### Not Prudent to Stand Alone

Is there no way out of the situation? There is none, if each system is going to stand alone and on its own. But it is not good for a utility—it is not wise, it is not prudent—to stand alone or to be alone. The alternative is to interconnect. Too often have we seen cases of trouble develop on systems—I have seen them happen numbers of times on our own system and have heard of many other cases on other systems—that would invariably have resulted in a partial cessation of service, and often in complete cessation, were it not for the fact that help was available through an interconnection which made it possible to carry on and keep service uninterrupted and unchanged just as if nothing had happened. And this brings me to a point that I have always felt has been almost totally overlooked in informing the people whom we serve of our activities. I will go further and state that on many occasions the information that we have given out has been of such a kind as to leave the layman with an impression wholly at variance with the facts and one that cannot help but be ultimately of considerably harmful effect to the utilities.

### Harmful Publicity

Why have utilities been so eager to rush into print with news of the various long-distance and spectacular interconnections that have been made? For example, the interconnection that was made between Chicago and Boston. Were these connections in any sense new accomplishments to be particular proud of? Certainly they involved no new engineering accomplishments in bringing to a conclusion a long-planned project. Here certainly they meant nothing significant from an economic standpoint. As a matter of fact, they were hardly more than stunts or tricks carried out by a few overzealous and young load dispatchers who could not resist the temptation of setting up this technical toy that was placed within their too ready reach. Granting, however, that no harm was done by carrying through the interconnection, there was still considerable harm done in broadcasting through the nation, as in that particular case, that power from Chicago, for example, supplied lamps in Boston. The harm consisted in conveying and giving to the public in general the idea that steam-generated power could economically be transmitted from Chicago to Boston, or that anybody who had any sense of responsibility would permit the carrying through of a project economically and technically so unsound. If publicity is sought in cases like that, let us adhere to the prosaic facts. Let us not stress the romantic side, even though that side has better publicity value.

Hook-ups of the kind alluded to, when carried out, have a certain amount of actual value, but the value is always no greater than the weakest link in the hook-up, and that, when examined carefully, will be found to be a link having a capacity of from 5,000 kw. to 15,000 kw. on the interconnections made to date. By a process of substitution or passing along it would be possible, therefore, to make available the capacity of that smallest link from one end of the system to the other; but that is an entirely different affair from transmitting energy from one extreme end of that system to the other end.

### Failure to Give Desirable Publicity

Instead of stressing the "stunt" aspect of interconnection, why do we not proclaim and broadcast the real deeds of interconnection every time one is accomplished? Why would it not be desirable to tell the public of the troubles that we encounter and the troubles we get into owing to the fact that apparatus, no matter how perfect, and plants, no matter how well designed, break down, and of the relief brought so instantaneously through the medium of interconnection that the public served is unaware that trouble has even occurred? Interconnection has accomplished wonders in this regard, and all with modest expenditures, which it was possible to absorb without any reflection in an appreciation of rates; but with a tremendous reflection in the way of improvement in service to a point where today absolute continuity is the only criterion by which service is measured. In the case of our own interconnections we have kept a record of the number of cases where interconnection has saved service in the last two years and these have run into more than thirty. Let me cite a number of them taken at random from our files:

*Case No. 22.*—In November, 1927, unit No. 1 at the Philo plant of the Ohio Power Company, which has a rating of 40,000 kw., developed internal trouble and was taken out of service for inspection and repairs. Two weeks later, and before unit No. 1 was replaced on the line, unit No. 2 of the same capacity developed internal trouble also and was removed from service, thus completely shutting down the Philo plant and reducing the capacity of the Ohio Power Company system by 80,000 kw. It was not possible to get unit No. 1 back in service until the following week. The accident to unit No. 2 was on a Saturday, and, owing to the fact that the load was light then, the system did not feel it; but when Monday came around the interconnections were immediately pressed into service and the following arrangements were made:

The connection with the West Penn Power Company was called upon for an additional 15,000 kw. The connection with the Ohio Public Service Company was called upon for the maximum possible load. The Cleveland Electric Illuminating Company was called upon, and it responded with a promise of all that could possibly be carried on its 66-kv. cables between Lake Shore and Oak Street substations, allowing approximately 50,000 kw. to feed into Akron and from there in turn into Canton, which is a point on the Ohio Power Company's system, this amount being fully 30,000 kw. above the normal supplied by Cleveland. The interconnection with the Southern Ohio Power Company was called upon, and that company responded with a promise of 5,000 kw., although later on it was found that this was not really necessary. The system south of the Ohio River, which had been receiving some help from the Ohio Power Company, was asked to call, in turn, on its interconnections, so that the Ohio Power Company was relieved of all necessity of helping it. Some of the minor interconnections were called upon for their quota. The result of all this was that the interconnected system load of the Ohio Power Company and the companies connected with it was carried without the slightest disturbance or hitch on Nov. 29 and until noon of Nov. 30, when one of the Philo units was placed back on the line. The load continued to be carried without the slightest interruption with a lesser call upon the interconnections until Dec. 4, when the second unit at Philo came on the line. In all of this, it may be noted in passing, no interconnections were called upon to transmit quantities of energy any long distance, but each interconnection was called upon to feed into that portion of the system where it was tied in its quota or its available amount of power, in some cases the relief being actually obtained by a substitution process.

Here was a contingency that could not possibly be foreseen or, if it had been foreseen, be designed for, and yet, through the help of interconnection, service to an industrial territory extending many thousands of square miles and to hundreds of thousands of consumers went on without the least disturbance.

*Case No. 10.*—The West Penn Power Company, which is interconnected with the Ohio Power Company at their joint plant at Windsor, W. Va., and at other points, had a case of trouble on July 13, 1927, at its Springdale plant. Unit No. 2 developed blading trouble and had to be pulled off the line. The operator pulled unit No. 1 off the line at the same time as this turbine was hunting and he believed it was also in trouble. This reduced the capacity of Springdale by 40,000 kw. At once the West Penn system itself picked up 5,000 kw. and the interconnected system picked up 35,000 kw. of this load. In the meanwhile the West Penn system brought additional capacity into service at its various plants, but it took approximately one hour to get this capacity on the line. During this entire period the interconnected system took care of 35,000 kw. and service to all the consumers of the West Penn Power Company continued without the slightest disturbance. What a beautiful story there is to tell here of the value and accomplishments of interconnection!

*Case No. 31.*—On March 29 and 30 of this year the northwestern section of Ohio experienced the most severe sleet storm that had been encountered in more than twenty years. The territory served by the Ohio Power Company in that section of Ohio is mostly agricultural, with a very small amount of industrial load. The loads are scattered and many miles of transmission line are necessary to serve it. The entire territory is served by two lines radiating from Lima, but during the sleet storm both went down, 88 poles being lost in a distance of about 16 miles. This division, however, is interconnected with the Defiance plant of the Toledo Edison Company. When Defiance was notified of the trouble it immediately picked up a portion of the system load—that is, that portion that was not in trouble—and as the lines were repaired the service was extended from Defiance. The Defiance plant continued to carry the load on all the northwestern division of the Ohio Power Company until Thursday, April 5, at which time the lines radiating from Lima were again placed in service. Here is another case of interconnection saving many days of interruption in an emergency which could not possibly have been foreseen or economically have been provided against except through interconnection.

I could cite many more cases, but you all are probably familiar with as many as I. The point is, however, that almost daily we have brought to our attention examples of what wonders interconnection is doing in the way of improvement in and maintenance of service without staggering expenditures, and almost daily we are missing opportunities to tell our customers, to tell the people of the villages, towns and municipalities in which we operate, to tell the nation, of what we are accomplishing by interconnection, of what interconnection is doing, of the fundamental thing that we are striving for in interconnecting. How much longer can we go on missing these opportunities?

## Customer Relations Committee*

By C. L. Harold, *Chairman*

In two aspects the committee determined at the start of the year upon a policy of expansion. First, in accordance with recommendations of the previous committee and national headquarters, beginning in November, 1927, the Service Suggestions have been published each month in the National Bulletin in lieu of the previous plan of printing a separate monthly folder under the title of "Service Suggestions" and mailing to a selected list of commercial and other executives.

Second, the committee thought that it should enlarge its usefulness by not only preparing and publishing monthly a Service Suggestion and gathering data in connection therewith, but it should also assemble information on other subjects which, although pertinent to customer-relations work, were not appropriate for general publication. The work has progressed considerably in this direction and we seize this opportunity of emphasizing to member companies the availability of this particular phase of committee service to individual member companies that might be interested. Member companies are invited to indicate freely their need for research or investigatory work which the committee is organized to perform and whose results we believe are not of sufficient general interest to warrant broadcasting to the entire fraternity.

In changing the method of disseminating Service Suggestions, the underlying thought in the plan of National Bulletin publication was that not only would the circulation or publicity be increased, but that any selected list for mailing a separate pamphlet monthly would almost certainly omit many individual employees of member companies whom it would be impossible to identify as interested in customer-relations problems.

The following Service Suggestions were issued during the present administration:

November, 1927—"The Executive, the Employee and the Customer Meet on the Job."
December, 1927—"Branch Office Layouts Designed for Better Customer Relations."
January, 1928—"Questions and Answers on Telephone Standard Practice."
February, 1928—"Educating Customers to Replace Blown Branch Fuses."
March, 1928—"Desk Contacts versus Counter Contacts."
April, 1928—"Résumé of Service Suggestions Issued by Customer Relations Committee."
May, 1928—"Use of Mechanical Devices in Complaint Handling and Appliance Demonstrations."
June, 1928—"The Customer and the Bill."

Inquiries for additional information from various members and member companies were received regarding every one of these suggestions. The résumé of all of the Service Suggestions issued by the committee since 1921 which appeared in the April N.E.L.A. Bulletin brought in requests from 45 members and member companies for approximately 2,500 copies of various Service Suggestions which have been reproduced and are now in the mails.

## PRIZE AWARDS

### *Charles A. Coffin Medal:*

Puget Sound Power & Light Company (see pages 1196 and 1197).

### *Doherty Medal:*

J. M. Whittier, Edison Electric Illuminating Company of Boston, "Industrial Development by the Central Station."

### *H. M. Byllesby Prizes:*

First—Herman L. Gruehn, United Gas Improvement Company, "Pensions."

Second—L. W. Clark, Utica Gas & Electric Company, "Economic Forces and the Public Utility Accountant."

Third—Claron D. Barber, Commonwealth Edison Company, "The Accountant and the Industry's Advancement."

### *Martin J. Insull Prize:*

Gail Belden, Middle West Utilities Company, "The Economics of Public Relations."

### *James H. McGraw Prizes:*

First—B. M. Riker, Charles H. Tenney & Company, "Industrial Electric Heat."

Second—Edward P. Price, San Antonio Public Service Company, "Lignite as a Commercial Fuel."

Third—W. T. Blackwell, Public Service Electric & Gas Company, Newark, N. J., "Street Lighting."

### *Arthur Williams Prize:*

H. W. Derry, Union Gas & Electric Company (Cincinnati), "Getting Your Share of the Power Business."

### *Harriet Billings Prize:*

Cladd H. Chase, Brooklyn Edison Company, "Effective Good Will Work Performed by the Distribution Department."

### *Frank W. Smith Educational Prize:*

Edwin D. Smith, Northern New York Utilities, Inc.

# Farmers Machinery-Minded*

Factory methods welcomed. Electricity the needed agency. Economics of farm service. Methods advocated by farmers

By Clifford V. Gregory
*Editor "Prairie Farmer"*

*Clifford V. Gregory*

ENGINEERS tell us that productive efficiency in this machine age depends largely on the use of power. From that standpoint the farmer ranks high. The average farm worker uses 4.5 hp., while the average industrial worker uses only 3.6 hp. In industry the average horsepower per man increased from 1.9 in 1899 to 3.6 in 1925, while in agriculture the average increased from 2.2 in 1899 to 4.5 in 1925.

The farmer of today is machinery-minded. That is nowhere better illustrated than in the grain belt of central Illinois, where for generations farmers have produced their crops with power machinery, until they no longer like to work with their hands. They hate to turn a crank, and who can blame them? They do not like to milk cows. They have been slow to turn from grain production to dairying and other intensive types of farming, notwithstanding all the educational efforts of the agricultural colleges.

Electricity is going to succeed where the professors have failed. It will succeed because it is making livestock farming a machine operation. When you can prepare the feed, do the milling and take care of the milk by machinery you have removed the obstacle that has kept the grain farmer from making the readjustment that he knows he could make at a substantial profit.

Dairy and livestock farming are profitable because they make a factory of the farm. It no longer sells raw materials. The dairy cow and the hog and the hen put the grain through at least one process of manufacture. On the farm which is equipped with electric power and electric refrigeration still other steps in the manufacture of finished food products are possible, and the profits of the farm are increased accordingly.

Farmers are thoroughly "sold" on the value of electricity. How are they going to get it? Certainly not through "juice peddlers"—promoters who build a line for a group of farmers at excessive cost, buy energy from a central station at wholesale prices and retail it to the farmer customers. Often they never get to that stage. They collect the farmers' money, build the line, and then go off and leave it to shift for itself. These promoters are parasites on the industry and have done more than everything else together to give it a black eye in the country.

### Opinions on Methods

Many companies have been following the practice of building country lines at the expense of their farm customers, in some cases returning the cost to them as a deduction from their monthly bills over a series of years. This plan does not encourage a large consumption of electricity, as the farmer is compelled to invest so much money in the line that he has little left for the purchase of equipment.

A plan which is being rapidly adopted, and which seems to be the most practical, is for the companies to build the farm lines at their own expense. in return charging a high monthly minimum. Four of the leading companies in Illinois, for instance, are now financing farm lines to the extent of $450 per farm and making a minimum monthly charge of $10 for energy furnishing 135 kw.-hr. for this price, with a charge of 3 cents per kilowatt-hour for any excess. If the farmer customer will buy equipment with the $450 which he might otherwise spend for line, he will make electricity a profitable investment both for himself and for the power company.

I. W. Dickerson, farm mechanics editor of the *Standard Farm Papers,* has given me the following figures to show the effect of equipment on consumption of energy: Lights only, 34 kw.-hr. per month; $100 worth of equipment, 68 kw.-hr.; $250 worth of equipment, 84 kw.-hr.; $300 worth of equipment, 117 kw.-hr.; $400 worth of equipment, 127 kw.-hr.

As a help to the more rapid extension of power lines into the country on a mutually profitable and satisfactory basis, I wish to conclude with the following suggestions:

1. The valuable experimental work conducted at the instigation of the National Electric Light Association should be continued, in order that we may learn still more about profitable applications of electricity to farm operations. Studies should be made of the place electricity holds in profitable systems of farm management.

---

*Abstract of address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

2. Rural lines should be built by the power companies. The farmers' money should be spent for equipment rather than for lines.

3. Erection of rural lines by irresponsible promoters should be discouraged.

4. Rates should be based on the principle of a relatively high minimum with a low charge for excess energy, in order to encourage increased consumption.

5. The question of prompt servicing of rural lines should be given more attention. As the farmer places more and more dependence on electric energy, he must be assured a supply that is practically free from interruptions.

6. Efforts should be made to supply electric equipment that is especially designed for farm requirements, and costs should be reduced if possible.

# Thunder and Lighting*

### By Clayton Rand

*President the Dixie Press*

IT IS a far and endless journey to the first picture that I would flash upon the screen of your fancy, for we find ourselves by the side of the man who first invented fire, in the flame of which he warmed his body and the rays of which spread light in his dank and dark, crude cave. I see him cooking for the first time the meat that heretofore he had eaten raw and setting up with his signal fires the first lines of communication. This ingenious primitive, playing with fire, was writing the first few wavering lines of the history of light and power.

The great achievements of light and power are better measured in what has been accomplished for modern man, as it has multiplied his power, increased his usefulness and reduced the burdens of living. I do not have to go back very far to picture my mother over a washtub, the insufferable heat of a wood cooking stove, on a warm summer's day, with an old-fashioned flatiron, and refrigeration limited to an occasional cake of ice wrapped in a piece of newspaper and stored in a box. I can picture the endless labor of that home, broom-swept, the hand-manipulated churn and the vigilance of an old-fashioned coffeepot.

Yesterday America was but a fumbling child among the nations of the earth, largely agricultural, as a whole a carrier of wood and water for the financial barons of England and Europe. Today under the magic touch of light and power, with half the world's motors in operation, each one of us has more mechanical slaves at his command than had our forefathers on the plantation in the palmiest days of the ante-bellum South.

### Mechanical Slaves Now Used

But I look upon electric power as a force as spiritual in its operation as it is material in its results. Long before the discovery of electricity did men not refer to the unfathomable soul within them as a spark divine? Who knows but that the search of science may yet reveal that this spark within is one electric, impregnated with the fire of an infinite God, energized with the processes of creation? And it would seem to me that the purpose that should inspire the work of you men and women who represent this great power for good in the increased happiness and prosperity of the world should be the consciousness of the fact that there is something well-nigh sacred in the way you use it—a strange force and power which, though utilized and somewhat understood, is yet as unfathomable as the fires which are kindled in the soul.

Clayton Rand

I appreciate the fact that power today is standing trial. I, too, have heard the voice of the critic in high circles, who stirs the emotions of his constituency by the charge that the so-called "power trust" is without soul or mercy. I also see in this great business of light and power men and women who are dreamers and builders, who through the years are constructing out of their faith and fancy the most formidable force that has been released in the experiences of men.

If you can conscientiously say that your purpose is one for the promotion of greater happiness and prosperity among the people, the voice of the "knocker," though never silenced, will become, in the light of truth, but "sounding brass and tinkling cymbals." I know intimately some of the great exponents of light and power in America, and I believe that I can testify that these men are moved by the bigger vision and the larger responsibility they owe their fellow men. I believe that they are dreaming and building to the end that this nation shall become one, not only completely electrified, but also fired by the faith of a conviction that will know no defeat until all of their high ideals are gloriously achieved.

# Good Merchandising Practice*

Fundamentals of merchandising outlined. Utility merchandising methods discussed and many methods and practices condemned

By Oswald W. Knauth
*Vice-President R. H. Macy & Company, New York*

TO A merchant the distribution of electrical goods is a part of distribution in general. The merchant, therefore, attempts to apply the same policies to electrical goods that he finds successful in other goods, and I think, if you will follow me, that I can best begin by stating a few fundamentals of merchandising and then see how those merchandising necessities link up with the particular peculiarities of the electrical business.

Oswald W. Knauth

I am always irritated when I hear a man say that the problem of merchandising is to have the right goods at the right time at the right prices. This statement makes it all seem so simple, and yet it is pompously enunciated as a profound truth over and over again. When we try to make a proper selection of electrical articles to offer our customers, we are confronted by a double problem.

First—We wish to offer them a proper choice of toasters, urns, flatirons, percolators, and so on, at varying prices and of varying designs. But then we find that different customers also prefer different types of make, some of which are in complete lines and others cover only a few articles. If, therefore, we attempt to carry a complete line of each different make, we find that we have a tremendous confusion of choice and great difficulty in keeping in stock on all of the items which we are carrying. Now, our object as merchants is so far as possible to help the customer in his choice, and to do this properly we must make that choice as easy as circumstances permit. Good merchandising would, therefore, demand one of two practices—either that we carry in any one store one complete line or that we carry such items out of each line as we believe to be the best, the whole, of course, constituting a complete selection.

Second—Good merchandising demands the satisfaction of the customer in buying what he or she wants. An article must not only be sold at a profit, but also must carry with it a certain amount of good will, which encourages the customer to come back and keeps the store going next week and next year. Salesmanship should be directed to this end, and our whole policy of allowing exchanges and so forth is to insure the fact that our salespeople do not oversell a customer. In order to accomplish this, salespeople must be controlled by the store and must be definitely supervised from the customer point of view.

Third—The costs of distribution vary greatly. It is too often taken for granted that these costs are of a definite fixed percentage. In fact, I wonder if the costs of distribution do not vary as much as the costs of manufacturing. For instance, advertising cost varies from 1 to 6 per cent. Rent varies with the volume of business done in a given space, from 2 to 10 per cent. Selling cost varies with the possibility of sales in different locations and with the excellence of service. Let me illustrate for a moment the causes for the variations in the cost of salesmanship. Every store does about double its average monthly business in December. Every store does a fraction of its average monthly business in July and August. Every store is much busier on Saturday than on any other day of the week. Every store is comparatively empty from 9 to 11 and from 4 to 5:30 and very busy between 11 and 4. Now, if we were to have enough trained salespeople to take care of trade in December on a Saturday between 11 and 4, we must be tremendously oversupplied in July on a Monday between 9 and 11. Therefore, we must make some arrangements which will offset this wide hourly, weekly and monthly variation. We do it by means of daily part timers, who come in at 11 and leave at 4; we have Saturday specials, who come in only on Saturdays, and along during the fall we build up a surplus force to take care of the Christmas rush. But at that we only do a partial job—

---

*Address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.

partial because the irregularities are so spasmodic and because we cannot pick up as expert sales clerks for such irregular intervals as we demand for our minimum business. You can see from this that every store must choose between great expense for selling and some degree of poor salesmanship, and the way in which each store chooses brings about a particular character for that store and a comparatively high or low cost of selling. This cost of selling may vary from 3 to 10 per cent.

Fourth—The completeness of choice varies in different stores. Some stores have a policy of low stocks and rapid turnover. Others have a policy of carrying exceptional articles for exceptional customer requirements. It is easy enough to achieve high turnover by keeping only such articles as are in normal demand. This means a low cost of storage and of inventory and ease of handling. It would seem to be the thing to do were it not for the sacrifice of good will when some customer demands some peculiar color or material or shape and has to go elsewhere to find it. That customer's normal trade is also likely to go elsewhere under these circumstances. Yet no store can afford to fill itself up with abnormal articles, for these rapidly turn into junk. Where to draw the line? This is the practical problem with which we merchants are faced, and it is as we answer this that we build up stores having different characters and having different rates of expense. These expenses are shown particularly in markdowns, which may vary from perhaps 2 to 10 per cent, but they are also shown in more or less expense of store operations.

### Methods of Utility Merchandising

Now let us look at the methods of retail distribution which you have built up in the electrical industry and see how they fit in with the demands of good merchandising. You have built up your systems on (1) more or less complete lines of articles; (2) an indicated retail price for each of these articles; (3) special demonstrations for the particular pushing of each line; (4) extensive advertising to build up a demand for your particular articles and for your name in general.

This system brings it about that you simply have to bring your articles into a store, be given floor space, and sales result. Prices are made, the demonstrator demonstrates, the public demands, and the supply is at hand. It is all very complete and very well worked out, and it is the easiest way for the storekeeper. And it works. Evidences of this are available at every hand. I need not go into this any further in such a gathering, for I know you are all familiar with it. I can therefore turn immediately to the problem of adapting this system to the necessities of good merchandising. I just want to interject one remark at this point: that is, that the necessity of sound merchandising is far greater today than, say, twenty-five years ago. There are more good merchants in the field, and competition is infinitely more keen. We cannot afford loose methods or loose thinking if we are to stay in business. Proofs of this are available at every hand.

Now, when your system is introduced into a store it brings about several grave difficulties from a merchandising point of view:

First, it brings about a duplication of similar articles if several lines are carried which really do not add to the customer's range of choice. This means more display space, difficulty of keeping in stock on the increased range of items, confusion in the stockroom, a multiplicity of many small orders. All this means that a store is apt to be sold out on its best-selling articles and add to expense generally.

Second comes the difficulty of bringing a customer to a rapid and certain choice. Why this toaster against that at the same price? The more she sees, the more uncertain she becomes. You attempt to meet this with your expert demonstrators, who can talk with conviction on the small conveniences and the hidden excellences of different devices; but when several demonstrators demonstrate conflicting excellences the confusion of the customer ends in rapid flight.

Third, your extensive advertising certainly familiarizes the public with your name and makes for ease of selling, unless the customer happens to bump into a rival display and demonstrator first. Then anything may happen. The demonstrator may play fair and sell rival goods, or may enter into a rapid supersales argument, or may disparage the other line and thus cast a doubt over electrical goods in general from which we all suffer. All this is impossible to control.

Fourth, is your practice of naming the retail price in advance. This is the easy way. But it is impossible from the point of view of really good merchandising—partly, as shown above, because the costs of merchandising are not fixed, but widely different; more especially, however, because the naming of the best retail price is a difficult matter and cannot be done at long range.

### Utilities Not Good Merchandisers

I come then to the conclusion that your system of selling is incompatible with the best merchandising practice. It may be effective for the small store in a small town. But it conflicts fundamentally with the necessities of large scale, economical and efficient merchandising practice. And a more effective way out must be found.

Before closing I want to add a few remarks in regard to the burning problem of public utility retailing of electrical goods. I do not take this problem of competition as seriously as some of my colleagues, for it has been my observation that the public utility methods of merchandising are so clumsy that they cannot be a menace to us, in spite of their many advantages, as long as we are as expert as we must be. Moreover, this public utility competition is not a national problem, because practices vary widely in different localities. Even were it dangerous, I cannot see on what grounds we as retailers can prevent public utilities from going into retailing or attempt to dictate to them what their policies should be. As a matter of fact, their policies can often be compared to existing retail policies, even if these are unsound and unsuccessful policies.

But I do raise one question with all earnestness to those who guide public utility policies. As I take it, you are interested in the sale of electrical goods, not for their own sake, but for the sake of increasing the consumption of energy. If this is the case, would you not be wiser and more successful if you studied the question of increasing these sales through the existing retail organizations, whose outlets are widespread and well-established, rather than add a single or several retail outlets, whose sales are an insignificant part of the total? Your present methods irritate and annoy the retailers who must make their living out of distribution alone. Why create this ill will? Would it not be more effective to study how to help them increase their distribution, so that increased energy will be consumed? And are there not greater possibilities of such increase than by setting up a rival distributing system of your own?

# What's New About Lamps[*]

## By Frank W. Smith

*Chairman Lamp Committee*

During 1927 a total of 305,000,000 large tungsten-filament lamps were sold in the United States. This is an increase of 3.7 per cent over the previous year's sales as compared with an 11.8 per cent increase of 1926 over 1925.

In addition, 12,600,000 large carbon lamps were sold in 1927, of which about 22 per cent were of domestic manufacture and the remaining 78 per cent were imported. The total large carbon lamp sales in 1927 were 31.8 per cent less than in 1926, which was virtually due entirely to the decrease in imported lamps. The sales of domestic-made large carbon lamps have remained about constant during the past three years, something less than three millions each year.

Most of the imported carbon lamps are sold to the public through the 5-cent to one-dollar chain stores, so it would appear that the considerable reduction in the sale of these lamps is largely due to the publicity given during the past year on the "costly bargain" of the carbon lamp to the home user.

The figures stated above do not include miniature lamps, such as those used for flashlight, Christmas-tree and automobile service. These data are as follows:

| | 1926 | 1927 |
|---|---|---|
| Miniature Tungsten Filament | | |
| Flashlight | 32,700,000 | 37,380,000 |
| Automobile | 116,300,000 | 116,500,000 |
| Christmas tree | 34,350,000 | 44,350,000 |
| Miscellaneous | 4,990,000 | 6,900,000 |
| Total miniature tungsten filament | 188,340,000 | 205,130,000 |
| Miniature Carbon Filament | | |
| Christmas tree | 12,680,000 | 13,415,000 |
| Miscellaneous | 1,030,000 | 1,050,000 |
| Total miniature carbon filament | 13,710,000 | 14,465,000 |

Christmas-tree lamps are generally supplied with current from central-station service, and as the current consumption of eight of these miniature lamps is the equivalent of one 40-watt lamp, the 1927 miniature Christmas-tree lamp sales are the equivalent in watts consumption of about 7,250,000 40-watt lamps, an increase of 20 per cent over 1926.

TABLE I—AVERAGE LUMENS, WATTS AND EFFICIENCY OF LAMPS SOLD EXCLUDING MINIATURE LAMPS

| | 1925 | 1926 | 1927 |
|---|---|---|---|
| Average lumens | 712.0 | 747.0* | 732.0 |
| Average watts | 57.6 | 59.6* | 59.0 |
| Average lumens per watt | 12.4 | 12.5* | 12.4 |

* Corrected 1926 values.

*Frank W. Smith*

Table I presents the average lumens, watts and efficiency (lumens per watt) of large lamps sold during the past three years, and Table II presents the relative demand for lamps during the past three years, divided into voltage groups. Table III shows the relative demand for the more important sizes of lamps during the past three years.

The average light output of street series lamps sold in 1927 was 2,293 lumens, slightly less than that of the year previous. The relative demand for the different sizes and ampere ratings of street series lamps during the past three years is shown in Tables IV and V.

During the past year the matter of voltage standardization has again been brought prominently to the fore through a revision of the book "Central Station Voltages," the last preceding copy of which was issued in 1923. The 1923 book was a cumulation of all the information obtained for several successive revisions and showed the proper lamp voltage for a total of 14,639 communities. With a campaign consisting of only one original letter and one follow up letter, the committee received information for publication in the 1928 book, covering 18,868 communities. Of the towns listed in the 1923 book, 3,917 are not covered in the recent issue, because the company supplying did not respond to the committee's inquiry. The 1928 issue includes, however, 7,746 towns which are listed for the first time.

The greatly increased coverage of the new voltage book is due in part to the greater interest of the industry in the matter of proper voltage conditions and in part to the ramifications of the large systems, some of which reported lists of communities served ranging up as high as 500 towns. Another reason for the greater coverage is

the trend in recent years of municipal plants to sell out to private companies or buy their energy wholesale from private companies. In past years it has been very difficult to secure voltage information from municipal plants.

Table VI gives a detailed statistical summary of the new voltage book as well as a comparison with similar data for 1923. The outstanding changes with respect to voltage in the five year interval are:

1. A shift of approximately 20 per cent of the total volume of service from 110 volts to 115 volts.

2. An increase of approximately 3 per cent in the percentage of total service at 120 volts.

3. The unification at one voltage for the entire city of over 50 per cent of the total volume of service in cities formerly supplied at more than one of the three standard voltages.

4. The practical disappearance of all lighting voltages other than 110, 115 or 120 volts.

In order to get a complete picture of the relative status of the three principal voltages, the populations of the communities having more than one voltage have been allocated to the individual voltages.

The object of compiling the voltage book is to eliminate as far as possible those instances where too high a voltage of lamps is supplied. The disadvantages, which are well known to the companies but not generally known by the consumers, resulting from operation of lamps of too high a voltage, are:

1. The customer receives less light and at a greater cost per unit of light.

2. The central station loses kilowatt-hour sales due to the decrease in wattage consumption of the lamps.

3. The manufacturer and dealer lose lamp renewal sales.

It is therefore to the best interest of all parties concerned that only lamps of proper voltage be used. A realization on the part of the dealer of the harm resulting from using lamps of improper voltage will almost invariably result in a change to the proper voltage.

The voltage book has been distributed broadcast throughout the electrical industry to all wholesale distributors of lamps so that they may have comprehensive information at hand as to voltage of lamps which should be shipped into the various communities they supply. Coincident with this, the lamp manufacturers are conducting a campaign with the wholesale distributors to the end that their full co-operation shall be rendered in supply of proper voltage lamps.

### TABLE VI—ALLOCATION OF POPULATIONS TO INDIVIDUAL VOLTAGES

| Voltage | Approximate Relative Total Volume of Electric Service, Per Cent | | Change |
|---|---|---|---|
| | 1923 | 1928 | |
| 110 | 36.3 | 15.9 | —20.4 |
| 115 | 40.9 | 61.6 | +20.7 |
| 120 | 19.4 | 22.4 | + 3.0 |
| Odd voltages between 100 and 130 | 2.7 | 0.1 | — 2.6 |
| High voltages, 200 and above | 0.7 | ..... | — 0.7 |
| Total | 100.0 | 100.0 | |

In order to realize the full benefit of this whole endeavor, it is necessary that the local retail dealers in lamps be in harmony with the central station in the matter. The most effective point of contact with the retail dealer on this subject is through the central station. All possible angles of approach to the problem of eliminating wrong voltage of lamps will have been covered if each central station gets out a circular letter to the local dealers advising them of the proper lamp voltage and of the losses in case a higher lamp voltage is supplied.

# Engineers for Economy*

Strive to get more out of investment dollars. Outline methods for planning system development. News of engineering activities

By E. C. Stone

*Chairman Engineering National Section*

*E. C. Stone*

WHILE there have been no radical advances in engineering practices during the past year, analyses of the work of the various committees show definite progress in the development of ways and means of obtaining "more system capacity per dollar of investment."

In power generation, intensive study has been given to the subject of availability for service of installed generating capacity. Actual performance data covering a large number of both steam turbines and water wheels over a period of years have been analyzed and published in serial reports of the prime movers and hydraulic power committees. Obviously, accurate knowledge as to the expectancy of outage to generating machinery will permit of more accurate determination of the installed capacity necessary to carry given loads. Because of the important part of the total system investment that is included in generating capacity this is an important item in over-all system costs.

The thermal efficiency of power generation from steam has been further improved. It is found, however, that the maximum efficiency is obtained only by a substantial increase in the cost of the plant. Hence the cost of fuel and the operating load factors expected over a period of years will have a vital influence on design. Where the load factor and fuel costs are low it does not pay to design for the best possible thermal efficiency. The expression "dollar efficiency" referring to the plant performance which will give the lowest over-all cost of energy per kilowatt-hour, including both operating and fixed charges, is coming to be a generally used term.

Economy data covering one year's operation of ten representative plants for pressures from 310 to 1,200 lb. show lower heat consumption for the higher pressure stations, but there is a greater tendency on high pressure to scale formation and more attention must be given to feed water treatment. The increased use of evaporators with and without chemical treatment is reported. Air preheaters for temperatures varying from 400 to 500 deg. F. have been installed with good results. An increase in the use of single-pass condensers is reported, notably, in connection with the larger turbine units. A comparison of the amount of condensing surface per kilowatt of turbine capacity shows 0.91 sq.ft. for single-pass condensers as against 1.22 for those having more than one pass.

The use of pulverized fuel, both in utility stations and industrial plants, is increasing rapidly, and high efficiencies and ratings are being reached. A number of units are operating between 200,000 and 300,000 lb. of steam per hour. Automatic combustion control is giving valuable results. Stoker capacities are being increased to meet the demand for heat radiation per square foot of available space. Water-cooled walls are reducing stoker and furnace maintenance cost and slag trouble. Of particular interest is the report on power station betterment which deals with the problem of bettering operating conditions in existing plants, with a view to obtaining maximum results from installed equipment before any additional expenditures are made for improvements.

Progress is reported in the commercialization of certain processes for the distillation of coal, and a number of plants are being located both in this country and abroad. The most notable in this country is a plant near New Brunswick, N. J., operating on the K. G. S. system for the production of lump fuel and gas for domestic use, and tars and oils. The Standard Oil Company of New Jersey has obtained the American rights for the Bergin's process covering the production of synthetic petrol.

## WATER POWER STUDIED

The hydraulic power committee has been giving special attention to the problem of forecasting water supply and important results have been obtained. While definite conclusions are not yet available, some of the methods used are showing surprising accuracy and it is hoped that they will soon be developed to such a degree of reliability as will make practical definite forecasting of water supply at least for short future periods. Water-wheel testing has also received intensive study. The value of maintaining accurate measurements of water

---

**Abstract of address before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

consumption is emphasized and new methods have been developed whereby such measurements can be obtained at practically any installation.

Recognizing the necessity for advanced planning of system development, the electrical apparatus committee has set up a sub-committee to deal with the fundamental planning of systems. Last year a tabulation of preferred system voltage ratings was published and a survey is now under way to determine to what extent the proposed voltages are in use or acceptable. This subject is now in the hands of a joint committee with the National Electrical Manufacturers' Association, whose business it is to submit definite recommendation for standardization of system voltages. This step will logically follow that made several years ago when standard utilization voltages were established.

The interconection of major power systems has continued to progress during the year. The definite advantages of interconnection are coming to be more clearly recognized to be increased reliability of service and more efficient use of generating capacity installed. Interconnection is not resulting in transmission of power over long distances, but is rather making it possible for adjacent systems to utilize each other's facilities to mutual advantage. While the economies of interconnection represent a large amount of dollars all told, it is probable that they do not bring to the companies to which they are available a saving in overall cost of power of more than 3 per cent to 5 per cent.

There are now twenty alternating-current low-voltage networks in operation. This type of system provides higher grade service for densely loaded urban areas at a substantially lower cost than is possible by other methods, and is accordingly coming to be recognized as the standard method of alternating current distribution for dense loads. A comprehensive study of motor operation on networks in service indicates clearly that there is no necessity for the development of a new line of 200-volt motors for network use. The starting of large motors on networks is being taken care of by step starters which provide for building up the starting current by definite ampere steps at definite time intervals.

The problem of short circuit interruption is still in the foreground, and while improvements in design have brought about better performance of circuit breakers, this situation is still far from satisfactory. An intensive investigation of the oil circuit breaker problem has been undertaken by a special committee of the Association of Edison Illuminating Companies. The Engineering National Section is participating in this investigation through official representation on the Edison's Association committee.

A special committee on system testing of oil circuit breaker interrupting capacities has developed a standard testing procedure and three major companies have already completed series of tests under this procedure. Comparisons of test results on different systems are thus possible.

The problem of short-circuit control also is being approached from the angle of definitely limiting the maximum values of current through system design. One of the most interesting principles employed is the paralleling of various generators through remote substations instead of over the bus in the station in which they are located, thus interposing line impedance between units.

Two field investigations are under way relating to the behavior of insulating oil in service in transformers and oil circuit breakers, one dealing with handling and treating methods and the other with oil deterioration. It is expected that much needed experience data will be obtained which should result in substantial improvements in methods of handling oil.

During the past year manufacturers of motors and all appliances, except washing machines, have agreed with the N.E.L.A. and A.E.I.C. to the adoption after Jan. 1, 1929, of a new line of fractional horsepower motors with substantially improved characteristics as to efficiency, power factor and starting current. The use of the new motors should help materially to solve the problem of voltage fluctuations, particularly in houses not adequately wired.

### Temperature Rating Used

Further progress has been made in establishing the principle of total temperature rating of electrical machinery.

The first step was taken when provision was made for increasing the rating of general purpose motors for a temperature rise of 50 deg. C. by multiplying the 40 deg. rating by a service factor. Now, through the efforts of our representatives on the standards committee of the A.I.E.E., it is expected that a basis will soon be adopted for the operation of transformers at loads above the standard rating when the ambient temperature is below the 40 deg. C. standard. Appreciable economic gain to the industry will inevitably result.

The overhead systems committee has centered its activities around an intensive study to determine the best possible design for overhead line structures. A survey of the entire country is being made to determine from actual experience the wind and ice loads to which overhead lines are subjected. The committees of the Geographical Divisions are actively co-operating in this work. Supplementing the results of actual experience, an exhaustive experimental investigation is being carried on at the University of Michigan. A special wood pole line has been erected which is being subjected to a wide range of wind and ice loading. Accurate measurements of the stresses developed are taken and recorded. It is proposed to continue this investigation next year.

A thoroughgoing study of rural line design and construction has been practically completed by the overhead systems committee, which will soon publish a serial report on recommended practices. This will reflect the combined experience and judgment of the best engineers in the country and should become the future standard for this class of construction.

The underground systems committee reports the increasing use on voltages as low as 11,000 of three-phase installations of three single-conductor cables in single large ducts. A comparative analysis of the cost of three 1,000,000-circ.mil single-conductor cables in one duct with three three-conductor 350,000-circ.mil cables in separate ducts, both designed to carry the same load, indicates a saving on the former over the latter of 59 per cent in duct system and 25 per cent in cable. Furthermore, the enormously higher dielectric strength of single-conductor cable as compared with three-conductor cable has been definitely established. Installation of metal-shielded conductor cables are increasing. At the end of 1927 there were 104 miles of this cable in operation without cable or joint trouble, as compared with 22 miles in 1926. Duct sections 1,000 ft. in length are being successfully used, thus effecting a reduction in manhole and joint costs.

Chairman Committee on Engineering Administration

*Bryon E. White*
Chairman Committee on Hydraulic Power

The research into the properties of paper-insulated cable has been continued and further progress made. The purpose of this research is to develop the facts necessary to make possible the writing of specifications which will cover the requirements and tests necessary to assure the purchaser of obtaining satisfactory and uniform cable of this type.

Analysis of operating results on underground cables actually in use show that defective workmanship accounts for the greatest number of joint failures from any one cause. There are five times as many failures in splicing cables due to poor workmanship and poor insulation as there are in the cable itself due to internal and electrical causes. It thus appears that our cable operating organizations are not keeping pace with the improvements of the manufacturers.

*J. C. Martin*
Chairman Committee on Inductive Co-ordination

The most important activities of the meter committee during the past year have dealt with the training of metermen throughout the country. This committee has fostered short educational courses on meters and metering practices at universities and schools all over the United States. The attendance at these courses has been very gratifying, and the result is bound to be an improvement in the average technique of our metermen. There has also been conducted a number of general group meetings of metermen of the various Geographic Divisions. The attendance at these meetings has been in the hundreds, and much good work has been done. The meter committee is now engaged in the preparation of a correspondence course which will be designed to provide material for the training of new employees as meter testers or to perform other duties in meter departments, and for others desiring a better knowledge of meters and metering.

During the past few years the inductive co-ordination committee has performed an outstanding service in crystallizing the basic problems of inductive co-ordination with the communication circuits and in training the engineers of member companies on this important subject. The committee has also served as an advisory staff to assist in directing the field surveys in the development and research program carried on by headquarters engineering staff.

Practical solutions are now being obtained so that situations involving inductive co-ordination can be worked out on the basis of the physical facts involved rather than on theory.

It is worthy of mention that recent meetings of the development and research committee have been outstanding in that discussions of work done and under way predominated, whereas in previous meetings the discussion had centered about work that should be done. The entire picture was one of a grasp and understanding of the work as well as of actual accomplishment that has not heretofore been so evident. Engineers of headquarters staff trained in these problems are available at the call of member companies to make field studies of conditions existing in specific troublesome cases.

The problem of voltage regulation at the customer's service is demanding more consideration as the practice of combined light and power circuits develops and the variety in types and characteristics of utilization apparatus increases. Voltage regulation is a very important factor in over-all distribution system costs. It has been generally held that incandescent lamps require very close voltage regulation and in many systems no expense has been spared to maintain a very narrow voltage range on the circuits carrying lighting service. Actual experience indicates, however, that such close regulation is scarcely justified and a trend toward broader regulation is noted in order to bring about a reduction of distribution cost.

The voltage regulation problem involves two factors: First, the maximum and minimum range of voltage, with the gradual variation between these limits as determined by magnitude of load, length of line, size of wire and voltage impressed; second, quick fluctuations in voltage which are caused by the operation of individual pieces of apparatus, as for example the starting of motors. The solution of the problem by improving system regulation is the most costly in many cases.

A specific case at hand where there is a tendency to demand unreasonably close regulation is found in the alternating-current radio sets now coming into general use. On account of the sensitiveness of the alternating-current tubes to voltage variation, considerable expense and complication is required in the design of sets of this type to meet the wide range of service voltages throughout the country. Nevertheless, it is unquestionably a fact that the cost of providing for this range of voltage in the radio equipment is insignificant compared to what it would cost the power industry to provide all over the country service voltages within a sufficiently narrow range so that regulating equipment would not be required on the radio set.

### Future Conditions

Looking forward to future conditions, the trend of which is clearly shown, emphasis is placed on the necessity for "more system capacity per dollar of investment" because of the increasingly important part that fixed charges are playing in the total cost of electric power service. Heretofore a major factor in the economies that have taken place in the power industry has been improvement in the efficiency of fuel consumption. Now, however, the cost of generation has become such a small part of the total cost of service that it is necessary to look elsewhere for further major economies, and the system investment offers the greatest field of opportunity in which to find them. In the past attention has been centered in reducing fuel and other operating costs. In the future it will be devoted particularly to economical system design and control of construction costs.

It is inevitable that the power industry will spend more money in the next ten years than in any past like period. It will be called upon to meet more exacting service requirements than ever before, and will be under greater economic pressure so that more careful attention will have to be given to every dollar spent. These are the engineer's problems and are more difficult than those which have confronted him in the past. There is therefore an important executive problem to be worked out in recruiting and training the necessary engineering talent and in providing an organization to enable it to adequately function. To meet these more exacting requirements the engineer must develop himself into a "scientific business man." His job starts with getting solutions to the physical problems but by no means ends there. He must be a good business man, a salesman, a diplomat and "must play with the team" if he is to deal successfully with those men with whom he must deal if his plans are to materialize. Just to the extent to which he anticipates executive judgment, which must be based on organization, commercial and public relations viewpoints as well as on engineering, to exactly that extent does he become a more valuable man to his company and himself, and put himself in line for bigger things.

# Codes and Standards*

By Irvin W. Day

*Chairman Codes and Standards Committee*

OUR obligation to the public in the supply of a necessary service requires that we weigh with impartiality and a fearless devotion to our public trust the fixing of rules and the adoption of standards for the conduct of our business. We want wise and reasonable rules—rules that are based on good, sound business economics—rules that have always the best interests of the public at heart. Therefore, having in mind the final costs, in the rendition of our service to the public and for which we in the end are responsible, it is necessary that we follow most intimately the formulation of codes and the adoption of standards for the conduct of our business.

The work of our committee during the past year has been largely concerned with co-ordinating the activities of the N.E.L.A. with the work and activities of other associations or groups. Harmonious relationships have been established and effective work started toward the elimination of confusion in standardization matters. Much wasted time and effort are still caused by the multiplicity of standardizing agencies. Attention was called to this situation in our report last year. There appears to be a wholesome desire on the part of every one to simplify standardization procedure, but prestige, brought about through years of contact or control, is perhaps the greatest barrier to real progress. While the light and power companies are not standardizing agencies and have no direct responsibility as such, their interests and those of the public they serve are indirectly affected by everything that is done along these lines. They are perhaps more directly affected by formulation of codes and should take a serious interest in their development.

We desire to bring to the attention of member companies the importance of recent code developments. We earnestly recommended that the executives of the member companies impress upon their engineering and operating organizations the necessity of becoming familiar with both the safety and fire codes as well as the various other codes which affect construction and operating methods of the power companies. Lack of interest or lack of familiarity with these matters may involve the expenditure of large sums of money by the power companies, and it is most important that each company designate some one in its organization to follow particularly matters relating to codes. It would be well that N.E.L.A. headquarters be advised as to the person so designated to the end that closer co-operation may be established between association headquarters and the member companies on matters affecting new codes as well as the revision of existing codes.

---

*Report presented at N.E.L.A. convention, Atlantic City, June 4-8, 1928.

# National Engineering Work*

Why a headquarters engineering staff is needed. Work of staff outlined. Relations with other organizations. Progress notable

### By H. S. Bennion

*Director of Engineering N.E.L.A.*

*H. S. Bennion*

THE National Electric Light Association had been organized thirty-five years before an engineer was placed on its staff. This happened about eight years ago. Today it has seventeen engineers, and these are spread out rather thin over the field they are supposed to cover.

The question arises as to why, after getting along thirty-five years without an engineering staff, the association should need such a big one now. There are two primary reasons for this. The first is that physical developments in the United States in recent years have expanded so greatly that the various elements bump into each other much more persistently than they used to. This is the case on the surface of the ground, underground, in the air and in the ether. We have not the elbow room we used to enjoy. Fields of interrelation and interdependence have multiplied. In the past five years the expansion of our electric plant and equipment has equaled the total growth of the preceding forty years.

The second reason for the engineering staff is to be found in the recent and rapid growth of other organizations, particularly national organizations of an industrial, technical and governmental character. The federal government alone has added some eighty-five bureaus, commissions and boards in the past twenty-five years. According to the Domestic Commerce Series of the Department of Commerce and reports of the National Research Council there are about 1,500 trade associations in America. There are 120 important technical and scientific associations and some 600 small and highly specialized organizations of this character. I have taken no account of civic, political, patriotic and religious societies, though any of these may undertake work having an important bearing on the development of the electric light and power industry. There are also many corporations of national scope, such as the American Telephone & Telegraph Company, the Western Union Telegraph Company, etc.

The building up of our staff has lagged a goodly distance behind the parallel development of these other organizations and behind the growth of the business we serve. To our credit, or perhaps to our discredit, we have not taken the initiative in furthering national work of this character. We have rather consistently waited to be pushed by the force of circumstances into more work. The appointment of an engineer to serve on the headquarters staff came years after the large and efficient Bell Telephone systems had become seriously concerned with inductive interference. Even today our force of twelve engineers devoting itself to the joint research and development program of the N.E.L.A. and Bell Telephone systems is small compared to the force of the American Telephone & Telegraph Company devoted to the study of this joint problem. Inductive co-ordination work undertaken jointly with the Western Union Telegraph Company adds to the task of this comparatively small force of ours.

The growth of the movement for standardization and codification and the turning by regulatory bodies toward the development of specificational rulings governing the public utilities has been the second important factor in contributing to the size of the engineering staff.

A third factor has been the administrative burden coming to the officers of the Engineering National Section and its committees as a natural result of the size of the association and of its consequence in the world of affairs. As I stated before, our physical structures have doubled in extent in the past five years, and this may be taken as a measure of the corresponding increase in our importance to the general welfare.

---

**Address, "The Purposes and Accomplishments of the Engineering Staff," before the N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

The fourth factor in contributing to the job of the engineering staff has been the demand for more research and survey work by the association. To date this demand has generally come to a head when relations with other organizations disclosed the need for certain specific information.

The foregoing are the major reasons for the engineering staff. Developments such as radio, aviation, etc., have just added so much to the job.

### JOINT WORK BASIC

The inference could well be drawn from the foregoing that we have strengthened our organization for purely selfish purposes; that each time we saw our interests seriously threatened we have built up the home guard to drive out the invader from our preserves. While it is true that there is this element in the development of our engineering staff, it is the minor element. As a matter of fact, we have organized to take on additional work as it has become patent that such organization on our part was badly needed in the general scheme of things. The product which we generate and distribute has become the lifeblood of the country. It is an indispensable or extremely important factor in most of the activities of the various important elements of the entire nation. Our physical structures occupy large areas and have characteristics of great moment to others. The telephone companies do not now and never have feared our organizing to tackle the inductive co-ordination problem. They have welcomed it. They hoped for such action on our part long before we acted. They have appreciated very clearly for a long time that in a field so technical and intangible real progress could only be made through co-operative effort and that the better organized we were in this respect the more able would we be to co-operate.

And who loses by such co-operative effort? No one does. The benefit is general. The two utilities directly concerned gain by this process because they are left just as free to reach their customers and to sell their respective services as the natural laws of induction will permit. They avoid the unnecessary losses which are bound to occur where artificial barriers or arbitrary conventions are imposed by an outside referee. The state regulatory bodies are relieved of the thankless task of laying down arbitrary rules governing a highly complex relation. The courts are freed from endless technical testimony and, most of all, the public is served without long delays and at a minimum over-all expense.

The importance of standardization and simplification to the general welfare of the country is so well appreciated that elaboration on the point is not warranted. It sometimes is not appreciated, however, that real progress in standardization is not made by fiat, law or arbitrary ruling, but only by co-operative and diligent effort on the part of all important parties concerned. Particularly is this true in the highly technical fields. The concerted effort of the electric light and power industry in developing electrical standards represents an enormous contribution toward the public good. This work could scarcely be accomplished without our organized assistance. Our expert technicians who devote in the aggregate countless man-hours to this particular work render a great public service, and this service is just as important to the public welfare whether they are furthering a sound proposal or opposing an unsound or premature standard.

In the fields of safety affairs the same general statements are equally true. Real progress in minimizing fire and casualty hazards resulting from the use of electricity can only be had with the help of an organized electric light and power industry. The co-operation of the engineers who design and install power generating and distributing plants, who establish the operating methods of the large systems, and who train and direct the operating personnel is essential to any safety program, not only in the development of codes, regulations and ordinances but in the further extension and perfection of the arrangements for preventing fires and accidents. The establishment of rules and requirements without their initiatory and helpful participation is bound to result in ineffective, possibly dangerous and unnecessarily burdensome requirements. The public will not be well served. It probably will not be adequately protected in important parts, and it will be unnecessarily burdened by other specifications.

This general elaboration can be shortened by stating that in the modern scheme of things the organized effort of each important industry is essential to the efficient promotion of the public welfare.

### JOINT WORK SLOW BUT IMPORTANT

In the carrying out of an extensive joint development and research program it is only natural that there should be a long interval between first obtaining the information in the field and the final issuance of a mutually acceptable report to the industry. The latest research data are, however, being applied rather generally throughout the country for the solution of inductive co-ordination problems through the participation of our staff engineers and those of the American Telephone & Telegraph Company in the handling of current cases. This knowledge is also made available and put to use through the large number of power engineers serving on the joint development and research sub-committees and on the inductive co-ordination committee. In other words, we are now cashing in on our research work and have been for some time. To a considerable extent, we have a working knowledge of this particular relationship.

In co-operating with the sub-committee on loading and strength of aërial lines the staff has contacted with the Weather Bureau stations and with a number of member companies throughout the country in furtherance of the program for obtaining records of glaze storms. A staff engineer covered parts of New England and the Middle Atlantic states in collecting records of the older pole lines. Contact was also maintained with the experimental work which is being conducted at the University of Michigan as a part of this general research project, to facilitate the procurement of instruments which can be used in the work.

At the request of one of our larger member companies, we have collaborated in the specification to accompany a joint use contract. This agreement, as I understand, is now being put to use between the companies of the Bell System and the subsidiaries of this power company. The specifications are available for the information of other companies. It is hoped that after a trial of two or more years this agreement and the specification may serve as a basis for action in this field by the joint general committee.

It seems to me most desirable from the standpoint of efficient public service in the whole utility field that so far as possible the utilities should work out among themselves the specifications governing their respective joint relations and that regulatory requirements and codes covering these matters should be confined to statements of principles and to the laying down of general rules. This makes for flexibility without sacrificing safety and permits keeping construction practices closer abreast of the advancing knowledge of the art. To bring this about the utilities must demonstrate that they are able to govern their inter-relations to the benefit of all concerned, particularly to the benefit of the public. When we have made this demonstration, we can then ask for the elimination of specificational matter from national codes and from state rules. Should this be effected, the necessity for frequent revisions of codes and state rules would be largely eliminated.

During the year we have participated in hearings before state commissions engaged in the formulation of regulations governing overhead construction in Maine, Iowa and Idaho. My assistant, Mr. Campbell, through familiarity with the provisions of rules in a great many states and through his intimate knowledge of the Safety Code and of the viewpoint of the other utility services in the fields of joint relations, can be of great assistance in the formulation of state rules and, in my opinion, can render an important public service in making his broad knowledge of this particular subject available throughout the country. This endeavor aids in the development of sound rules since profit is had from the experience of others.

We have assisted the oil burner sub-committee of the general merchandising committee in making a survey of the extent of use and the characteristics of the oil burner. We hope to assist in more such surveys. Our industry must take a leaf from the Gas Association and conduct research projects in the field of utilization to determine with more precision the fields of use for our product and the limits within which it can successfully compete with other products. These are matters of concern to the engineer as well as to the sales force. Our industry must keep abreast of the times in getting business.

We have assisted the special committee on the marking and lighting of airways with a view of keeping the industry informed of the developments in that field and in an effort to aid the Department of Commerce in its desire to obtain central station power for airway beacons and for landing fields. A survey was made of the experiences of a number of member companies in furnishing such service and in dealing with the problems presented by the developement of airports at the larger towns and cities.

### Codes and Standards

In the field of codes and standards we have been particularly active. My assistant, Mr. Maxwell, has made it a point to cover all meetings of the American Engineering Standards Committee, of its electrical advisory committee, of the electrical committee of the National Fire Protection Association and to attend meetings of the larger inspectors associations. In addition, we have participated in numerous miscellaneous meetings and conferences where code matters were involved.

With the present state of organization in the field of standardization, as pointed out at the beginning of this talk, it becomes mandatory that our association have a message center, so to speak, to which all the latest information of what is going on in the field of codes and standards is reported. This center must also be a historian's office from which the continuous record of any standardizing movement can be had. This need my office has been directed to fill. Since it is being depended upon for this purpose, it becomes more and more essential that individuals and committees engaged on standardization projects keep headquarters posted on developments relating to their assignments.

I need not enumerate here the machinery set-up and the procedure adopted by our association for handling its share of the standardization load. Suffice it to say that there are 150 current standardization projects in which we are participating. I should like, however, to call your attention to one point that those of you who have not seen hard service in the standardization mill may overlook. Our association machinery is big and slow moving. As an industry we are notorious for having divided views on questions—technical and policy. Among the numerous standardizing bodies it frequently happens that certain of the projects are moving comparatively fast. Our association must act quickly or forever hold its peace. We on the staff in our rôle of maintaining routine contact are like sentries on outpost duty and frequently must decide whether there is time to call up the main body to attack the question at issue or whether we ourselves must engage it with the limited force at hand. In other words, it often happens that we must take the initiative, procure an answer quickly and give it authoritatively, sometimes making commitments of importance on our own responsibility. These are emergency actions and I call attention to them because our motives might be misunderstood and because their occurrence emphasizes the desirability of keeping headquarters posted in matters bearing on codes and standards so as to reduce the chance of our giving the wrong answer in such a situation.

In addition to the foregoing general tasks, which we have with us more or less all the time and which form the main grist of the work of the Engineering Staff, there are multifarious duties that come to hand from many quarters. These are too numerous and too fleeting in character to warrant enumeration. Since engineering forms the foundation of our business, it goes without saying that there are points arising from time to time upon which engineering comment is useful to management. Our rule of conduct on the Engineering Staff is to make ourselves generally useful by contributing wherever possible to the common good.

## Essentials of Industrial Relations*

By Homer E. Niesz

CONTACTS with the individual customer occurring at best but a few times a year, and including all the elements of personality, may easily create bitter hostility, irritation, passing satisfaction or even occasionally lasting enthusiasm, depending upon the character, intelligence, appearance, manner and genuine desire to serve which the employer manifests. These statements, emphatically true of face-to-face contacts, are, in a modified but an equally important degree, also applicable to contacts by correspondence and by telephone. Improved performance, it would seem, can only result from specific training, critical supervision and regular measurement of personal service given. These three lines of advance require full recognition of the supervisor's responsibility for training in his group.

# Government in Industry*

Lax public interest in government produces critical business reactions. Obligations of industry and of government

By John E. Edgerton
*President National Association of Manufacturers*

*John E. Edgerton*

WHAT has been taking place in your particular industry and in the general field of public utility is only an acute local manifestation of a general tendency of government. It is a cutaneous outbreak of an organic disease on our political body. This malady was prophetically diagnosed twenty-five hundred years ago by a wise Chinese philosopher who said: "As restrictions and prohibitions are multiplied in the empire the people grow poor and poorer. When the people are subjcted to overmuch government the land is thrown into confusion. When the people are skilled in many cunning arts strange are the objects of luxury that appear. The greater the number of laws and enactments the more thieves and robbers there will be. Therefore, the Sage says, 'So long as I do nothing the people will work out their own reformation. So long as I love calm the people will right themselves. If only I keep from meddling, the people will grow rich. If only I am free from desire, the people will come naturally back to simplicity. If the government is sluggish and tolerant, the people will be honest and free from guile. If the government is prying and meddling, there will be constant infraction of the law. Is the government corrupt? Then uprightness becomes rare and goodness becomes strange. Verily, mankind has been under delusion for many a day. Govern a great nation as you would cook a small fish—that is, don't overdo it.' "

Even his most unforgiving enemy or unsparing critic cannot say truthfully of the President of the United States, Calvin Coolidge, that he has been noticeably lacking in that rarest of qualities in public life today—courage. Whatever other judgment history may pronounce upon him, if it be true to its purpose of unimpassioned record of fact it will say that no servant of the people of the United States was ever more consistently courageous in resisting the encroachments of federal government upon the prerogatives of its citizens. When he was Governor of Massachusetts he was moved by his observations of tendencies in that state to say that "the alternative of private ownership and control is public ownership and control. Broadly extended this is communism."

As a matter of fact, gentlemen, there are extremely few people in America today who are willing to admit their belief in the principle of government ownership and operation of the instrumentalities of production and distribution. On the contrary, most of those who are lending themselves to the enterprises of socialism either through non-resistance or active connivance are loudest in the repudiations of socialistic purpose. They are wearing the cloaks of Republicanism, Democracy, Progressivism and other political regalia. Practically every legislative body in the land from the board of aldermen or commissioners of the smallest town to the Congress of the United States has in it members under one name or another who are constantly looking for opportunities to project government into that territory of competitive private enterprise for which it was never intended by our fathers.

Then there are others in the same bodies who have not enough information, understanding or intellectual energy to offer effective resistance and who thus become the unconscious tools of selfish leaders. Outside of but tangent to this circle of political privilege and opportunism is another which includes, besides the usual motley elements of communistic hybrids, an army of retired or retiring millionaires and the widows of others who obtained their wealth in many instances through dubious processes and are now helping to sustain the forces that would wreck free government. Verily, of all the trusts that menace the future of our country today the political trust looms as the most sinister; and in this intemperate day of inquiry into the affairs of others it is high time that the people should get together and appoint a committee to investigate it.

### Public Interest in Government

Only a renaissance of patriotic interest in government, on the part particularly of the better informed and more responsible elements of American society, can accomplish the needed reforms. It can not be done merely by organized denunciation and protest, for this is the

---

**Abstract of address before N.E.L.A. convention, Atlantic City, June 4-8, 1928.*

known common resort of those seeking refuge from the condemnations of a consciously guilty record. And upon none does the obligation of leadership in the restoration of constitutional government fall more heavily than upon industry and its controlling forces; for not only is it always the first and greatest victim of bad government, but those who guide its destiny have an equipment in experience and understanding which peculiarly qualifies them for the tasks of good citizenship. To lead successfully in any constructive work, however, it is necessary to wear the impenetrable armor of a clean record. A soldier conscious of secret disloyalty to the aims of his belligerency lacks inevitably the courage without which effective fighting is impossible.

We all know that there are in the industry and business some who are unscrupulous in their methods and practices, preying upon public confidence and plundering helpless people. That is as undoubtedly true of my branch of industry and the others as it is of yours. There is no advantage in refusing to recognize a fact so obvious. On the contrary, the sooner the honest majorities of the organized trades not only recognize but meet it with vigorous and unmistakable disapproval, the easier it is going to be to get government back into its proper place. All too long have industry and business shielded their crooked actors by furnishing them harbors of safety in their organizations and by failing to establish and maintain codes of ethics through the impartial operations of which the black sheep may be distinguished from the white. This situation supplies to ambitious government and designing politicians all needed excuse for their pestiferous inquisitions. It is the unconscionable few who thus bring embarrassment, inconvenience and sometimes destruction to the innocent many. At this point lies the richest opportunity which the trade organizations have for service both to themselves and their country. Let them devise methods of handling their own prodigals and thus remove even a seeming necessity for government intervention.

Then, too, if you will examine the record carefully, you will discover that in many if not most instances government has got into industry and business largely upon its own invitation. It is not an uncommon occurrence to see in Washington and at other seats of government groups of industrialists and business men actually petitioning government to extend its powers and functions, to establish this board or that, or to interfere here or there with the business of somebody else. The average trade or business organization is usually concerned about what the government does or does not do so long as it does not pester that particular group. On the other hand, it is wont to rejoice in the discomfiture of a competing group even if such occasion of joy weakens the general position by impairing a principle upon the maintenance of which the security of all depends. Government is quick to sense and take advantage of such opportunities of disunion, and by playing group against group it nullifies resistance to its advances in the ostensible interest of the common good.

Finally, there is no way to cope successfully with organized error except with organized truth. It is true that wars of defense and for righteous principle are sometimes even more expensive than wars of offense and aggression. That is especially true with wars waged upon an industry by government. Not only do the innocent parts of that industry suffer, but those of all others eventually share the harmful consequences. In the present circumstances, therefore, when the instinct of legislative investigation is so manifestly aroused and government is so obviously bent upon competitive engagements with its citizens, it is the clear duty of all industry and business to share the burdens of common defense against unjust and unnecessary attack. In the meantime, and as security for the future, every trade and business organization should clean itself where necessary and should so live that when its summons comes to join the innumerable caravan which moves to that mysterious committee room in the boisterous halls of Congress it go not like a quarry slave at night scourged to his dungeon, but, sustained and soothed by a clear conscience, let it approach the seat of investigation like one who wraps the drapery of his couch about him and lies down to pleasant dreams.

# Private Ownership Gives Service*

By Franklin T. Griffith

*President Portland Electric Power Company*

THERE is no general accusation that our statements supporting the cause of private ownership and operation are untrue, but we are specifically charged with spending large sums of money for the purpose of creating favorable public sentiment on behalf of private operation. In the minds of proponents of government ownership this practice of ours is deemed highly reprehensible, and our right to use any portion of our revenues in placing our cause before the bar of public opinion is questioned.

We believe that the cause of public service in its broadest aspect can be best served and the development of the industry promoted by giving full play to inventive ingenuity, to constructive financing and to sane and logical extension of the use of the service we give. We believe these activities would be stifled under political ownership and management, and we also believe they can be brought to the highest pinnacle of success only by that plan calculated to bring to the highest degree of perfection the capacity and ability of the individual. We advocate no new principle in this regard, but we stand four-square on the fundamental principles of our government. An attack upon the principles for which we stand is an attack upon our government itself.

This government was never formed or intended to function as a business organization except in so far as business necessarily is involved in government. We are against socialism and we are unalterably opposed to communism. We are, in our corporate and individual capacities, citizens of the United States. The right of free speech belongs as much to us as to any other group of citizens. We do not object to the dissemination of views differing from ours, but we most strenuously do object when such different views are bolstered and supported by plain misstatements of fact, and I insist that when we challenge misstatements of fact made by those who would plunge the nation, the states and the municipalities into the dark pool of political operation, we are doing that which is not only our right but our duty as citizens as well as representatives of the industry of which we are a part.

# News of the Industry

## Forty-five-Million-Dollar Hydro Plant Planned

*New Move Made in Development Projected on Upper Connecticut River at Fifteen-Mile Falls by New England Power Association*

PERMISSION to build a hydro-electric development on the Upper Connecticut River to yield 220,000 kw. from the stretch known as Fifteen-Mile Falls in the district between St. Johnsbury, Vt., and Littleton, N. H., was sought in a petition filed on June 1 by the Grafton Power Company with the Public Service Commission of New Hampshire. The New England Power Association is the parent company in the project, which was noted a year ago by the ELECTRICAL WORLD as in contemplation and which is one of the largest ever undertaken in the East. At this writing it has not been decided whether the construction work will be begun this summer or not, as certain negotiations in progress remain to be satisfactorily concluded, should a favorable decision be rendered by the commission after hearing the petition.

The Fifteen-Mile Falls development will represent an investment of approximately $45,000,000. About 330 ft. of fall in the river is embraced in the scheme, which has been receiving extended engineering study for some years past. To a representative of the ELECTRICAL WORLD President F. D. Comerford of the New England Power Association stated that if the project is carried through as planned, it will be handled as a single comprehensive development rather than as a small-unit piecemeal program. A hearing has been set for June 27 at Concord, N. H.

## Supply Jobbers Change Their Name

*Will Henceforth Be Known as the National Electrical Wholesalers' Association—E. Donald Tolles Is Made Managing Director*

AT ITS twentieth annual convention, held at Hot Springs, Va., this week the Electrical Supply Jobbers' Association unanimously voted to change the name of the association to the National Electrical Wholesalers' Association. At the same time E. Donald Tolles, who has served the association for many years as its executive secretary, was appointed managing director.

George E. Cullinan of the Graybar Electric Company, the chairman, in his opening address on Wednesday morning said that the jobber was not sick, but that he had his problems, which were caused mainly by rapidly changing conditions in the business. He also said that the greatest current misconception of the jobber was that he buys and sells instead of acting as a distributor and warehouseman, which was his actual function. Another misconception was that the jobber does not do a promotional job. This was refuted by Mr. Cullinan, who also pointed out that selling methods depend on the type of products.

H. T. Bussman, vice-president of the Bussman Manufacturing Company, St. Louis, spoke on Wednesday evening on what is to be gained by the four branches of the industry through co-operative effort as provided under the Industry Sales Conference. Mr. Bussman expressed the belief that the conference would do something which no one association in the industry or no one member could accomplish alone. Summed up in one sentence, he said that the four branches of the industry could co-operate to lay the groundwork for a bigger and better business.

An equalization of dues reported and adopted by the association will reduce the cost of membership to more than 90 per cent of its members. The association also voted to support the Industry Sales Conference in making its proposed survey preliminary to the formulation of a plan of procedure.

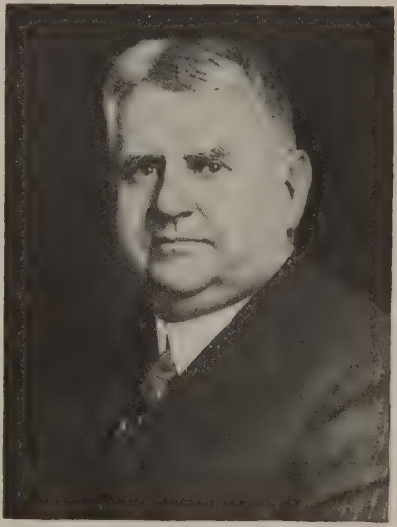
On Thursday evening O. H. Caldwell of the Federal Radio Commission spoke on the radio situation. A demonstration of talking movies, using the Western Electric sound projector system, closed the session.

The following have been elected members of the executive committee of the association:

H. O. Smith of Akron, J. A. Duncan of Chicago, G. H. Wahn of Boston, E. J. Coyle of Philadelphia, L. T. Milnor of Cincinnati, chairman of the Central Division; W. E. Robertson of Buffalo, chairman of the Atlantic Division, and A. J. Cole of the McGraw Electric Company, Omaha, executive committeeman at large.

## Public Service of New Jersey Celebrates

### Twenty-fifth Anniversary of Company's Formation Marked by Banquet at Newark—Leading Men in Various Pursuits Praise Its Achievements Under T. N. McCarter



*Thomas N. McCarter*

BEFORE a representative gathering of men prominent in the public, professional, business and industrial life of New Jersey and outside that state, the Public Service Corporation of New Jersey celebrated its twenty-fifth anniversary at the Robert Treat Hotel in Newark on June 1. Co-operation between the Public Service Corporation and the public was the keynote of the many congratulatory speeches made at the banquet. More than six hundred men heard from the lips of Governor A. H. Moore glowing testimony to the value of the Public Service Corporation in the development of the State of New Jersey. He referred to it as an institution, rather than a corporation, which has become part and parcel of the state.

Thomas N. McCarter, organizer of the corporation and its president since formation, was the toastmaster. He painted a wonderful picture of the future greatness of New Jersey and of the opportunities lying before the Public Service Corporation. The utterance that received the greatest acclaim, however, was Mr. McCarter's announcement "that in recognition of the long and loyal service of those who have served the corporation and its subsidiaries twenty-five years (some 750 in number), and who as a result wear the Public Service gold button, the board of directors has directed, as of this day, a payment to each of these employees of 10 per cent of their year 1927 compensation."

Mr. McCarter did not dwell at great length on the accomplishments of the corporation during the quarter century of its existence, choosing to let the record speak for itself. "While it is pleasant to look back over our accomplishments," he said, "yet our eyes are fixed upon the future, not the past. New Jersey is not in the twilight of its life. It is rather at its sunrise. New Jersey has just commenced to grow." He visioned the day when there will be a vast community between the Hudson and the Delaware Rivers, when every steam railroad will be electrified, when gas will be the fuel used, when every portion of the state will be interconnected electrically, and when the Public Service Corporation's system will be tied in with the large power systems of New York and Pennsylvania.

How much of that development he himself would see Mr. McCarter did not know, but he said: "While I am charged with my present responsibility, the flag with which we started, bearing the same old legend, 'To develop the State of New Jersey and to make it a better place in which to live,' will remain nailed to the Public Service mast to be seen of all men."

In congratulating the organization, its stockholders and the public in general on the achievements of the first twenty-five years of Public Service, Owen D. Young, chairman of the board of the General Electric Company, declared: "Full meed of credit should be given the men of imagination of Public Service who at its inception were looking forward with courage, self-sacrifice, determination and supreme confidence. Imagination means the leadership of the world."

Similar sentiments were expressed by A. W. Thompson, president of the United Gas Improvement Company of Philadelphia, and by Edmund W. Wakelee, vice-president of the Public Service Corporation in charge of law.

Besides the toastmaster and other speakers at the head table were Senator E. I. Edwards, Joseph F. Autenreith, president of the State Board of Public Utility Commissioners; John B. Miller, chairman of the board of the Southern California Edison Company; Samuel T. Bodine of the U. G. I. Company of Philadelphia, and Edward T. Stotesbury of Drexel & Company, Philadelphia. Among the guests were a number of prominent public utility men from nearby states.

While the dinner was the overshadowing event of the anniversary celebration, a number of other features formed part of the occasion. Every office of the Public Service Corporation throughout the state was appropriately decorated with flags, and a short time before an oil portrait of Mr. McCarter was unveiled in the directors' room in the Newark terminal.

Among the records of the Public Service Corporation the following are of interest. Since its inception the company has expended more than $300,000,000 in improving and extending its electric, gas and transportation facilities. It has paid in taxes more than $105,000,000. It has increased the number of its stockholders from a few hundred to more than 74,000 in 1927. It has increased the number of electric customers more than 42 times. It has increased its annual electric sales by more than 57 times. It has built an industrial power load from virtually nothing to one representing more than 60 per cent of the entire industrial load of the territory served. It has made far-reaching reductions in rates and at the same time has increased its annual revenues by nearly seven times.

Since 1903 $163,000,000 has gone into additions to and extensions of electric facilities. The generating capacity of the system has been increased more than sixteen times; fourteen old stations have been scrapped and five new stations have been built. Approximately twenty thousand persons are at the present time employed by the company.

# Gadsden Answers Attacks on Utilities

## Chairman of Joint Committee's Executive Body Deprecates "Premature Conclusions" and Defends Companies' School and Other Literature

THROUGH the office of the Joint Committee of National Utility Associations, Washington, the following statement with regard to alleged use of the schools for private utility company propaganda and the companies' literature in general has been issued for publication by P. H. Gadsden, chairman of the executive committee:

"I have attended several hearings of the Federal Trade Commission in its present inquiry into public utilities, and I have noted that some newspapers have drawn what seem to me to be premature conclusions from the evidence so far introduced in the record. For instance, it has been said that propagandists employed by the public utilities have penetrated the educational systems of the country, distributing material unfairly praising the services of public utilities and improperly criticising and condemning public ownership, that textbooks have been written or rewritten by authors subsidized by the public utilities, and that professors have been paid to write the utilities' propaganda into books on economics and civics.

"These characterizations of the activities of the representatives of the utilities are unwarranted by the evidence so far introduced and are basicly untrue. Representatives of gas, electric, street-railway and telephone companies have from time to time made examination of textbooks used in some of the public schools. Incorrect statements relating to the utilities, obsolete material and omissions of essentials have occasionally been found. In some instances also distinct propaganda favorable to government ownership, accompanied by unfair attacks upon the privately owned utilities, was discovered. Such conditions, when noted in connection with the surveys made, have frequently been called to the attention of school authorities and publishers. In some cases the biased material has been eliminated by the responsible parties.

"The charge that textbooks have been formerly introduced in the schools by public utilities' representatives directly or indirectly has no foundation in the evidence taken or in the facts. Utility representatives have no facilities for such an enterprise and would not use them if they had. In many states the public utility companies have been requested by university, college and school authorities to assist in associating the theories taught in educational institutions with the actualities of the business world. The companies have thrown open their plants to visits and inspection by teachers and students. They have given vacation employment to hundreds of young men who plan to enter the business on completion of their education. They have provided talks to students explaining the salient features of their operations. This is an industrial age, and such instruction is essential to prepare students for the conditions which will confront them when they go to work.

"Public utility companies have prepared and furnished to teachers—not to students, as a matter of fact—pamphlets explaining the business of operating gas plants and electric light plants, carrying on telephone communication and operating electric railways. These are instructive and informatory booklets containing historical and technical data and statements of fact as to which there can be little, if any, dispute. These pamphlets should frankly disclose—and so far as I am informed invariably have done so—their origin upon their covers. If a teacher desired to use them in his classes, he obtained them by asking for them. If he did not ask for them, he did not receive them.

"I have not, of course, been able personally to examine each of these pamphlets, but as to those I have seen the standard of accuracy and truthfulness has been highly maintained. Every one will agree that in publications to be used in any manner in the schools controversial matters should be eliminated so far as possible and prejudice and bias strictly avoided. In this respect the pamphlets I have examined will fairly stand the test.

"The investigating agents of the Federal Trade Commission are now engaged in putting the evidence in the record. They are not commenting on it as it goes in or passing premature judgment upon the activities disclosed. Subsequently the commission will sum up the evidence, draw its conclusions, formulate its recommendations and make them public in its report to the Senate. Also, the record itself will be available for general examination, as it is now, from time to time as accumulated. It is hoped that premature conclusions, based on partial and sometimes not unprejudiced presentations in some of the newspapers, will be avoided so far as possible by the general public.

"As for literature combating government ownership and operation propaganda, this has, of course, been distributed somewhat widely by representatives of the utilities. I do not feel any inclination to apologize for this material. The propaganda on the other side has been enormous and most energetically distributed and circulated. Moreover, private initiative has been the rule in the United States and its results have seemed to justify it as the American system. If the utilities have been able to assist in maintaining the American standard, they are unlikely permanently to be criticised for doing so. The increasing appreciation by consumers and the public of the usefulness of the service rendered by the utilities is the best evidence that private initiative is quite capable of performing the task.

"In Pennsylvania the Public Service Information Committee, in response to requests from county school superintendents, distributed 120,000 copies of booklets. By reason of erroneous inferences drawn by individuals who neglected to obtain complete information, the committee desired to secure a fair and impartial review of these particular activities. Therefore a letter was addressed to Dr. John A. H. Keith, State Superintendent of Public Instruction, requesting that he appoint a committee to review these booklets so that the facts might be established. That procedure, I am informed, is being followed in other states, so that the educational authorities themselves will pronounce judgment upon the material contained in booklets. Dr. Keith has appointed a committee to review the material in Pennsylvania, and I am confident similar action will be taken elsewhere."

## Davidson Defends Nebraska Utility Pamphlet

J. E. Davidson, former president of the National Electric Light Association and vice-president of the Nebraska Power Company, has issued a statement to the public in which he says that furore about the testimony before the Federal Trade Commission with relation to a 30-page pamphlet sent to some of the schoolteachers of Nebraska is an effort to make a mountain out of a molehill.

"As a member of the executive committee of our national association I know of the work being done," Mr. Davidson asserts in this statement. "I examined carefully the manuscript of the pamphlet circulated in Nebraska, and no one connected with the industry in the state has any apologies to make for its contents. I challenge any one to point out one sentence of propaganda of any sort within its covers. Surely there can be no poisonous propaganda in telling this interesting story, a plain story written for the sole purpose of acquainting the youth of today with the great servant electricity."

## Rocky Mountain Officials on the Stand

*Director of the Public Utility Information Bureau and N.E.L.A. Division Secretary Explain Activities Before Federal Trade Commission Investigation*

AT THE session of the investigation into public utility companies by the Federal Trade Commission on Thursday, May 31, Theodore J. Grayson, director of evening schools, University of Pennsylvania, took the stand at his own request in order, as he explained, to correct errors in testimony of a previous witness relating to the manner of the establishment in the university of a public utilities course for public utility employees. Mr. Grayson testified that the course, which was begun in the institution about five years ago, was the outcome of a request on the part of the Pennsylvania Public Service Information Committee to the university authorities, that everything was done in a frank manner and that there was no dictation or even suggestion by the utilities as to the manner of teaching the course or the matter to be taught therein. Mr. Grayson had been paid by the Joint Committee of National Utility Associations $250 each for three speeches he had made in which he opposed government ownership and had derived other income for services rendered to utility organizations.

Another witness was the director of the Rocky Mountain Committee on Public Utility Information, George V. Lewis of Denver. This committee now has an annual appropriation of about $18,000, according to Mr. Lewis. The committee is opposed to the Swing-Johnson bill for the development of Boulder Dam, Mr. Lewis said, but it has done nothing against the project beyond "relaying" literature calling attention to what public utility men regard as a menace.

Several years ago, Mr. Lewis testified, a survey of textbooks was undertaken for the committee by Hubert P. Wolfe, a research fellow of the University of Colorado, part of whose salary the committee paid. A report on high-school activities, made after the third year of effort, said that the committee was "rapidly withdrawing from mental circulation the countless counterfeit ideas relative to the public utility business which have been foisted upon the people for so many years by the unfriendly, the misinformed and the prejudiced." Mr. Lewis next identified checks aggregating more than $1,600 which he said had been paid to Prof. W. C. Duvall, of the engineering school of the University of Colorado, for conducting a survey of municipally owned plants for the Rocky Mountain committee.

Mr. Lewis' testimony, continued on Friday and Saturday, further developed that the Rocky Mountain committee was interested in the appointment of a fact-finding committee on the Colorado River project under the auspices of the University of Colorado. Mr. Wolfe had helped in preparing arguments to be made before the board of regents in favor of setting up such a committee.

The witness testified that his committee undertook to combat through local utility managers a municipal ownership movement which it called the "income-warrant menace." This he defined as a financial device intended to induce municipalities to take over public utility plants. He testified that a pamphlet on the subject was distributed through the state, and he identified a report in which he was credited with retarding this movement.

Orville A. Weller, secretary of the Rocky Mountain Geographic Division of the N.E.L.A., testified that the national body contributes about $4,000 annually to the support of the division and that the utilities in Colorado, Wyoming and New Mexico spend from $1,200 to $1,700 on the association. He explained a power survey undertaken by the association recently as being intended to obtain data on the probable growth of its member companies. Denying that its purpose was to show the advantages of private over municipal ownership, he said that it grew out of repeated statements by tourists that Colorado's tremendous power is going to waste. He said that they received this impression from visiting the state during the high-water season.

The Federal Trade Commission will resume its inquiry on June 11, after the N.E.L.A. convention is over. Officials of the Texas and Louisiana-Mississippi information bureaus will be the first to testify, according to the arranged program.

## Shoals Bill Not Approved

*President Coolidge Fails to Sign Measure Within the Constitutional Time Limit, and It Therefore Cannot Become Law Before Next Session*

FAILURE of President Coolidge to affix his signature to the Muscle Shoals bill left in his hands by Congress before the expiration of the constitutional ten-day time limit, which was at midnight on Thursday, June 7, has killed the measure for the time being at least, though it can, of course, be repassed and again put before the President when Congress reassembles in December. The "pocket veto" fulfills the prediction that because of the President's consistent opposition to putting industrial functions into the hands of the government, he would not make the bill a law.

Meanwhile, Representative Cannon of Mississippi, former parliamentarian of the House, has stated that nothing but the United States Supreme Court can untangle the difference of view as to the effect of failure of presidential approval between sessions. Mr. Cannon also says that it has been the unanimous opinion in both the House and the Senate, when similar questions have come up, that a pocket veto has no effect in preventing a bill from becoming a law.

# First Building at Leaside Under Construction

*Ontario Hydro-Electric Power Commission's New Transformer Station Will Handle 220-Kv. Energy Supplied on Contract by Gatineau Power Company*

THE first 220-kv. step-down transformer station in Canada is now being built by the Ontario Hydro-Electric Power Commission on a site in the town of Leaside, Ontario, just northeast of Toronto. This station, when completed, will be one of the largest single transformer stations on the continent. Some time ago a contract was made with the Gatineau Power Company for the supply of 260,000 hp. of 25-cycle power, to be delivered to the commission. In order to bring this power from the place of delivery to a point where it could be fed into the Niagara system, two single-circuit 230-mile, 220-kv. transmission lines will be required—the first in Canada at this voltage. One of these lines is now under construction, and, according to a progress report, about 60 per cent of the work has been done and there is every reason to expect that the original time limit set for completion, Nov. 1, will give ample margin. The station site at Leaside, where the line will terminate, covers twelve acres. Energy will be supplied from this station at 110 kv. to the Niagara system and at 13,200 volts to the Toronto Hydro system.

The seven oil circuit breakers will be approximately 22 ft. high to the top of the bushing and occupy 45 ft. by 10 ft. each. Each tank, of which there are three per circuit breaker, will require 5,000 gal. of insulating oil. In spite of the large size of these breakers and their heavy moving parts, it is expected that they will completely interrupt the circuit in one-half second.

The transformers are the biggest single-phase water-cooled units yet built in Canada. Four banks will be required to handle the Gatineau contract. The control of all circuit breakers, disconnecting switches, tap changers and synchronous condensers is centered in a room 35 ft. by 45 ft in size.

Active work at Leaside was started a few weeks ago, the first building to be constructed being the erection building required for the assembly of the electrical equipment. This building is fitted with a 75-ton electrically operated overhead traveling crane. It is to be of brick and concrete with structural steel framework. The manufacture of the electrical equipment is well under way at Peterboro, Toronto, Hamilton and St. Catharines. The schedule requires the first portion of the station to be ready to receive power by Oct. 1.

The Paugan Falls plant of the Gatineau Power Company, 32 miles above the mouth of the Gatineau River, in Quebec, rapidly nearing completion, which is designed for an ultimate capacity of 470,000 hp. and an initial output of 272,000 hp., will probably supply most of the 260,000 hp. called for under the contract, though the plants now operating at Chelsea and Farmers Rapids and serving the International Paper Company will take care of inequalities and emergencies. A dam being built below the Paugan Falls will back the water up to Chute Calumet, a distance of 30 miles, drowning out nine falls and rapids and creating a head of 136 ft. At Paugan Falls one unit of 34,000 hp. is now ready for service, and a second one is expected to be ready very soon.

*Paugan Falls development of the Gatineau Power Company*

# Denver Contractors Oppose N.E.L.A. Committee

Recommendations made by the wiring committee of the Commercial National Section of the N.E.L.A. have brought forth a strong protest from 65 Denver electrical contractors, which has been presented in writing to the Electrical League of Colorado. The contractors say:

"This report leads definitely toward the conclusion that the central stations should enter the electrical contracting business, employing electrical contractors or wiremen as their workmen on a piece-work basis, and that the cost of conducting such electrical contracting business should be absorbed by the central stations under the advantages which they are now employing in many cases to conduct merchandising departments without regard to costs or profits. Such a policy would inevitably establish the level of contracting and wiring prices in the minds of the public at such levels as to destroy the business of electrical contractors attempting to operate on a normal basis of profit."

# Northwest Association Ready for Portland Meeting

The program for the twenty-first annual convention of the Northwest Electric Light and Power Association, to be held at the Multnomah Hotel, Portland, Ore., on June 19 to 22, has been issued. Following are the events of main interest:

GENERAL SESSIONS

*Tuesday Morning, June* 19.—President's address, A. C. McMicken; address, P. S. Arkwright, vice-president N.E.L.A.; address, J. M. Thomson, president Idaho Public Utilities Commission.

*Wednesday Morning, June* 20.—Report Commercial Section, J. C. Plankinton; address, E. C. Greenwood, commercial director N.E.L.A.; address, J. T. Jardine, chairman Oregon C.R.E.A.; "The New Day in Merchandising," Stephen I. Miller, executive manager National Association of Credit Men.

*Thursday Morning, June* 21.—Report Engineering Section, O. L. LeFever; address, W. H. Onken, Jr., editor ELECTRICAL WORLD; report Accounting Section, F. W. Brownell; address, Prof. C. S. Dakan, University of Washington.

*Friday Morning, June* 22.—Report Public Relations Section, George L. Myers; finals in employees' and managers' public speaking contests and reading of winning essays in three competitions; address, P. S. Clapp, managing director N.E.L.A.

Dancing, boating, golf, cards and excursions will fill the afternoons and evenings.

# Getting Ready for Camp Co-operation VIII

Camp Co-operation VIII, the annual conference of representatives of electrical leagues, will be held at Association Island, near Henderson Harbor, N. Y., Thursday, Aug. 2, to Tuesday, Aug. 7, inclusive. The first three and the last two days will be devoted to business sessions. This camp will be held under the auspices of the League Council and sponsored by the Society for Electrical Development, as in the past. Attendance will be by invitation, which will be extended to officials of leagues and others actively interested in local and national co-operative development of the market.

The business program has already received consideration. It is the purpose to emphasize those features of local co-operative work and market promotion that will make the league productive of larger results and a force of greater influence in its community. To this end addresses and papers will be presented and discussions conducted on those league practices noteworthy for their successful results. Profitable objectives the league should strive for and elimination of wasted effort through the selection of worth-while activities will receive major attention. There will also be opportunity for discussion and exchange of experiences in the problems of league operation and management. The "red seal" plan and other national movements for widening the market will come in for their share of consideration.

## Purchases and Mergers

*Pennsylvania Power & Light Asks Authority to Buy Controlled Companies and Acquire Others—Southwestern Public Service Sold to Texas Utilities Company*

PLANS for consolidation of Lehigh Power Securities Corporation properties in Pennsylvania were revealed last week by the filing of applications with the Public Service Commission by the Pennsylvania Power & Light Company for authority to acquire outright 35 small operating properties already controlled by it and to obtain control of ten others. The new companies of which control is sought include, in addition to gas, railway and water concerns, the Harrisburg Light & Power, Lehighton Electric Light & Power, Pine Grove Electric Light, Heat & Power and Juniata River Water Power. The companies which the Pennsylvania Power & Light wishes to acquire outright include the East Penn Electric of Allentown and plants in various boroughs and towns. Among the larger places are Juniata, Honesdale, Hummelstown, Montgomery, Montoursville, Hughesville, Clymer and White Haven.

Purchase of the holdings of the Southwestern Public Service Company, consisting of fourteen public utility plants in Amarillo and other towns of the Panhandle of Texas and eastern New Mexico, by the Texas Utilities Company and the New Mexico Utilities Company is announced by Judge I. R. Kelso of St. Louis, president of the Texas Utilities Company. The purchasing companies are owned by the same interests and operate 43 plants in northwestern Texas and New Mexico. Transfer of the properties will be made on July 1. The merger will give the 43 towns in which the Texas Utilities Company has been operating a connection with the gas-fuel power plant erected in Amarillo last year by the Southwestern Public Service Company. The transferred properties are estimated to be worth upward of $4,000,000. The Southwestern Public Service Company operates to the northeast of Amarillo as far as Pampa, a power transmission line running from Amarillo through Panhandle to Pampa and west into New Mexico as far as Carlsbad. The Texas Utilities Company covers a wide territory coming as close to Amarillo as Canyon, 20 miles to the south.

Application has been been made to the Arizona Corporation Commission by the Public Utilities Consolidated Corporation of Arizona to purchase the American & Foreign Utilities Corporation of Delaware from the W. B. Foshay Company of Minneapolis. The Delaware organization controls the Alaskan Utilities Company of Alaska, the Managua Utilities Company of Nicaragua, the Eel River Power Company, near Indianapolis, and the East Minnesota Power Company of Minnesota.

The Western Public Service Company of Scottsbluff, Neb., has purchased the locally owned plant at Mitchell and will serve it by transmission lines.

The Kentucky holdings of the General Power & Light Company of New York have been bought by the Kentucky Utilities Company. They include an electric transmission system connecting the towns of Calhoun, Corydon, Rumsey, Poole, Slaughters and Sebree.

The Illinois Commerce Commission has granted the Central Illinois Power Service authority to purchase the Elizabethtown Power & Light Company system for $8,681.

The Midway electrical distribution system, near Kannapolis, N. C., has been acquired by the Southern Public Utilities Company from the Midway Lighting & Improvement Company.

The People's Hydro-Electric Corporation of Vermont, Montpelier, Vt., has petitioned the Vermont Public Service Commission for authority to acquire properties in Eden, Hyde Park and Wolcott, identified under the name of the Green River Power Development, for $163,571.

## Impetus to Hydro Development in New York

*Court of Appeals Decision in Niagara, Lockport & Ontario Case Removes a Source of Delay by Public Service Commission*

WATER-POWER development in New York State on a scale far greater than anything in the past may follow action by the Public Service Commission now that the Court of Appeals has upheld the validity of the so-called Miller water-power law. At least half a score of proposed mergers of power resources are awaiting action by the commission, which had postponed decision pending the outcome of the litigation which the Court of Appeals passed upon last week.

One of the first cases that will receive consideration is that of the Rochester Gas & Electric Company, which has an application to absorb a small neighbor under the terms of the water-power law. The provision of the law which had been challenged as unconstitutional was one which said in effect that a water-power company developing the major part of any specific site might, as a matter of public convenience and necessity, absorb by right of eminent domain another concern that was developing a minor part of the same site. As reported last week (page 1159), the Court of Appeals upheld this principle in the litigation that grew out of the application of the Niagara, Lockport & Ontario Power Company, made almost four years ago, to take over and develop certain power resources on the Salmon River in Oswego County owned and operated by the Horton interests, which had a minor devlopment on a power site there where the Niagara, Lockport & Ontario had a major development.

The Public Service Commission granted the request of the Niagara, Lockport & Ontario Company. The ruling was the immediate sequel for a battle of the courts. Attorneys for the Horton interests argued that approval of the application meant that the big water-power companies of the state would gobble up their smaller neighbors.

## International Union Meets at Paris on July 5-10

Announcement comes from Paris that the Union Internationale des Producteurs et Distributeurs d'Énergie Electrique will hold its next congress in that city on July 5 to 10. The program provides for the formal opening on Thursday morning, July 5; business sessions on Thursday afternoon, Friday morning and afternoon, Saturday morning and afternoon, Monday morning and Tuesday morning, July 10, and the closing session on Tuesday afternoon. There will be a reception at the City Hall on Saturday, excursions by automobile to Chantilly, Fontainebleau or Longchamp on Sunday, and visits to various power houses and industries on Monday afternoon, as well as the reception of a delegation by the President of the Republic and a banquet at the Cercle Interallié, followed by a "soirée artistique."

A provisional trip through the region of the Pyrenees, to follow the congress, has been arranged, though all the details cannot be finally determined until the number of participants is known. Those taking this trip will leave Paris on Wednesday morning, July 11, and journey to Bordeaux, whence they will depart on Thursday afternoon for Pau, leaving there next day for Lourdes. Sunday the trip will end at Carcassonne.

The National Electric Light Association is represented in the Union Internationale by John W. Lieb of New York, Samuel Insull of Chicago and Charles L. Edgar of Boston. To the coming congress William H. Onken, Jr., editor ELECTRICAL WORLD, has been appointed by President Sands as an additional delegate. Mr. Lieb will present reports on public relations, electric vehicles, and electrical accidents and resuscitation.

## London Sectional Meeting of World Power Conference

A sectional meeting of the World Power Conference, to be held at the Imperial Institute, London, from Sept. 24 to Oct. 6, will take the form of a fuel conference. This meeting, organized by the British national committee of the World Power Conference, with the approval of the international executive council, will be the second sectional conference since the plenary meeting in the summer of 1924, the first of these having taken place at Basle, Switzerland, two years ago. Representatives of the United States will participate.

The program is divided into five classes and four intersecting divisions. The classes are: (I) Solid fuel; (II) liquid fuel; (III) gaseous fuel; (IV) fuel utilization, general; (V) general aspects. The divisions are: (1) Composition and classification of fuels; (2) preparation of fuels; (3) storage, handling and transmission of fuels; (4) utilization of fuels. The divisions are subdivided into sections, and in the first three classes 35 subjects are in this way arrived at. Under "fuel utilization" come three topics—utilization of electricity for industrial heating, utilization of electricity for domestic heating, and waste-heat recovery. Under "general aspects" three further topics are included—the training of fuel technicians, a survey of the scope of organizations concerned with the efficient use of fuel in industry, and the economic possibilities in the better coordination of fuel utilization.

The papers may be written in English, French or German. They shall not exceed 7,500 words, and every paper is to be accompanied by a résumé not exceeding 500 words in either of the two languages other than that in which it is composed. O. C. Merrill, executive secretary of the Federal Power Commission, Washington, is the secretary of the American National Committee of the World Power Conference.

## Empire State Commercial Section to Meet at Utica

Meeting at Utica, N. Y., on June 28 and 29, the Commercial Section of the Empire State Gas and Electric Association will carry out a program including the following papers:

*Thursday Morning.*—"Commercial Department Organization and Management," W. J. Reagan, Utica Gas & Electric Company; "Home Service," Mrs. Sarai Waugh, Westchester Lighting Company; "Future Load Estimation," F. T. Bolster, Syracuse Lighting Company; "Rural Use of Service," R. F. Bucknam, State College of Agriculture.

*Thursday Evening.*—"Electric Refrigeration," Walter O. Howe, Niagara, Lockport & Ontario Power Company; "Electric Water Heating," H. C. Wilder, Northeastern Power Corporation.

*Friday Morning.*—"General Merchandising Policies," H. C. Wilder, Northeastern Power Corporation; "Merchandise Accounting," H. C. Davidson, chairman Accounting Section; committee reports.

H. O. Palmer, president of the association, will address the Friday meeting.

## Rural Electric Session for the Agricultural Engineers

The annual meeting of the American Society of Agricultural Engineers will be held this year at the Hamilton Hotel, Washington, on June 19 to 22. On Thursday, June 21, there will be morning and afternoon rural electric sessions, with E. A. White, of the Committee on the Relation of Electricity to Agriculture, in the chair. The following papers by prominent central-station officials, engineering-college professors and others are scheduled:

*Morning.*—"Organization of an Electric Light and Power Company for Rural Development," G. C. Neff; "The General-Purpose Motor," Charles P. Wagner; "Electric Characteristics of Rural Lines," Prof. Frank D. Paine; "Research in Rural Electrification, 1927," R. W. Trullinger; "Extension Methods for Rural Electrification," Prof. H. B. Walker; "Recent Developments in Rural Rates," E. A. Holloway.

*Afternoon.*—"Round table" on electricity in the farmhouse, Mrs. John D. Sherman, Miss Eloise Davison, E. C. Easter and H. J. Gallagher taking up respectively the general topic, cooking, refrigeration and water supply, and Dr. Louise Stanley, chief of the Bureau of House Economics, Department of Agriculture, leading the discussion.

# Briefer News

IOWA TOWN REJECTS COMPETITIVE PLANT.—Voters of Missouri Valley, Iowa, a place of 5,000 population, at a special election just held refused a petition of the Des Moines Utilities Company for permission to establish and operate an electric light plant in that city, which is served by the Iowa-Nebraska Light & Power Company.

AMPÈRE'S HOME PRESENTED TO FRENCH ASSOCIATION.—The boyhood home of Ampère, near Lyons, France, has, a cable dispatch to the New York *Times* says, been purchased by Sosthenes Behn, president of the International Telephone & Telegraph Company, and his brother Harmand, and presented by them to the Société Française des Electriciens for the purposes of an electrical museum.

VIRGINIA-CAROLINA POWER COMPANY PLANS 50,000-HP. PLANT ON THE ROANOKE.—The Virginia-Carolina Power Company has applied to the Federal Power Commission for leave to construct a concrete dam on the Roanoke River, in Brunswick County, Va., and Warren County, N. C., to be used for public utility purposes. There will be a head of 35 ft. and the dam will back water for about 20 miles. The surface area of the reservoir will be about 3,500 acres and the estimated storage about 500,000,000 cu.ft. A steel and concrete power house is planned with a proposed installed capacity of 50,000 hp., which will be used for public utility purposes.

I. E. C. ADVISORY COMMITTEE TAKES UP STANDARDIZATION OF STEAM-TURBINE TEST CODES.—Word has been received by cable that a meeting of the steam-turbine advisory committee of the International Electrotechnical Commission held at The Hague, Holland, during the week of May 20 was a noteworthy one, eight nations being represented by 23 well-known engineers. This committee is attempting to reconcile the various test codes for steam turbines now used throughout the world and to develop a standard code for international adoption. The United States was represented by I. E. Moultrop, Edison Electric Illuminating Company of Boston, and Francis Hodgkinson, Westinghouse Electric & Manufacturing Company.

TRANSMISSION LINES TO GO UNDERGROUND AT LONG BEACH, N. Y.—Following a spectacular fight in the endeavor to erect overhead transmission lines at Long Beach, a Long Island (N. Y.) seacoast resort, in which early-morning construction gangs, the police and court injunctions played a part, with wrangling municipal officials at odds over whether the lines should be permitted, the Queens Borough Gas & Electric Company has agreed, in deference to public sentiment, to the revocation of a permit previously issued, to remove lattice towers already erected, to fill in existing excavations and to place all wiring underground in conduits. The sandy nature of the soil has led to some doubt as to the feasibility of underground construction.

LIGHTING COURSE AT NELA PARK NEXT WEEK.—From June 11 to 16 a general course in lighting will be given by the Nela School of Lighting at Nela Park, Cleveland. In the last seven years 1,500 students have attended the 30 one-week courses that have been given, and advance registration proves that this month's course will be attended in excess of expectations. Registration is open to all men and women engaged in the lighting business.

ENLARGED TRANSMISSION SYSTEM OF MEMPHIS POWER & LIGHT COMPANY.—Completion by the Memphis Power & Light Company of a new substation in South Memphis has provided a link for its Mississippi and Arkansas interconnections and with a substation recently built in the northern part of Memphis, at Decatur Street and Lane Avenue, will play an important part in the enlarged service now given as the result of a program initiated when the company was reorganized five years ago. The South Memphis substation has a capacity of 15,000 kva. It is tied to the Memphis power plant through two 12,000-volt double four-phase circuits and to the Mississippi and Arkansas properties through a 110-kv. line running south to the Tennessee-Mississippi line. There will soon be completed also an interconnecting line with the transmission system of the West Tennessee Power & Light Company, adjoining the company's territory to the north.

BONBRIGHT & COMPANY ISSUE HISTORICAL ELECTRIC MAP.—"A historical map of the United States of America representing the development of the electric light and power industry" has just been issued by Bonbright & Company, New York, from a design by Ernest Clegg. This is a beautifully illuminated and lithographed map, 42 in. by 27 in. in size. Superimposed upon it, besides charts showing the capital invested, the energy generated and the voltages in use by the electric light and power industry in 1928, are 24 small pictures illustrating the outstanding events in electrical invention and progress from the production of the Brush arc lamp in 1876 down to the 220-kv. transmission, the gigantic steam turbo-generators and the huge hydro-electric dams of the present day. The map is drawn on the scale of 100 miles to the inch and will prove a worthy ornament for light and power offices and board rooms.

MISSOURI COMMISSION APPROVES NEW RATES OF UNION ELECTRIC LIGHT & POWER.—The Missouri Public Service Commission has approved the reduced rates of the Union Electric Light & Power Company of St. Louis, which became effective in that city on June 1. The new rates, explained in the ELECTRICAL

World for May 12 (page 984), will reduce the annual income of the company on the basis of present consumption $700,000. Large consumers benefit most from the cut rates. Residence rates for St. Louis remain unchanged, but residence rates for St. Charles, Washington, Festus, St. Clair, Pacific, De Soto, Union and other towns served by the company in St. François County were reduced. To meet the new rates of the Union Electric Company, the Laclede Power & Light Company, which supplies electricity to about 17,000 consumers in St. Louis, on June 1 filed a schedule of lower rates with the commission. The reduction, which affects only commercial and industrial consumers, will reduce the power and light bills of its large consumers $75,000, or 7 per cent, per year.

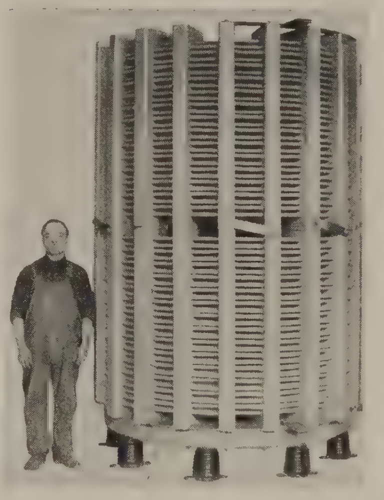
Foshay Purchases San Francisco Building.—Establishment of Pacific Coast headquarters of the W. B. Foshay Company, public utility operator, in its own building, recently acquired in San Francisco, and plans for expansion on the Pacific Coast, have been announced by W. B. Foshay, president. The building is on Kearney Street and after remodeling will be ready for occupancy Sept. 1.

Washington Water Power Company Buys a Site on the Spokane.—The Washington Water Power Company of Spokane has purchased a power site of the Spokane Valley Power Company on the Spokane River a few miles below the city. There is said to be a potential head of 80 ft. and a potential power development of 15,000 hp. at low water.

Colorado Public Service Company Will Not Impair Royal Gorge.—An announcement has been made by the Public Service Company of Colorado that it will abandon plans for developing power on the Upper Arkansas River near Cañon City rather than impair the scenic value of the Royal Gorge. It asks the Colorado Public Utilities Commission to determine what flow of water through the Gorge is necessary to preserve it as a scenic wonder and asserts that it will never reduce the flow below the volume held to be necessary. If engineers determine that the river's flow above the specified volume is insufficient to justify the hydro-electric development, the latter will be abandoned, the company states.

Survey of Lower Devil's River in Texas to Follow Filings on Upper Sites.—Application has been granted by the Texas Board of Water Engineers to James C. Kennedy of Dallas, understood to represent the Insull interests, for authority to make a power survey of Devil's River from the point where it empties into the Rio Grande for one-half of its length. The purpose of this exploration is to determine how much water power may be available for generating electrical energy. The Insull interests already have filed on the upper flow of Devil's River and will construct one or more hydro-electric plants under their original authority to appropriate water from that stream. If the survey of the lower flow of the river justifies such action, they also will construct a large hydro-electric plant above Del Rio. From these proposed plants a power transmission line will be constructed to San Antonio and other points.

A Giant Reactor for Baltimore.—A neutral grounding reactor rated at 80,000 kva. on a four-minute basis is being built by the General Electric Company at Pittsfield, Mass., and will be installed at the Westport station of the Consolidated Gas, Electric Light & Power Company of Baltimore, to ground its 25-cycle system. It stands over 9 ft. high and weighs 8 tons. The reactor is of standard cast-in concrete design and is supported on eight extra-heavy porcelain insulators. This apparatus is the largest of a number of giant reactors manufactured by the General Electric Company in recent months. Several of these have been supplied to the Brooklyn Edison Company for its Hudson Avenue station. Nineteen are to be used in sectionalizing the 22,000-volt bus of the State Line Generating Company's station at Hammond, Ind. Still another, of the iron-core type, was recently installed at the Amite (La.) substation of the Louisiana Power Company.



American and Mexican Engineers Fraternize.—Addresses by railroad executives, industrial managers and educators were features of the fourteenth annual convention of the American Association of Engineers, which was held in El Paso, Tex., this week. Simultaneously Mexican engineers were in convention at Juarez, across the Rio Grande, and opportunities for fraternizing were plentiful. After the convention four specially planned trips took delegates to Cloudcroft in the Sacramento Mountains, to the Elephant Butte Dam in New Mexico, to the Carlsbad Caverns in the Pecos Valley, and to the Boquilla Dam near Santa Rosaria, Mexico.

Pennsylvania Railroad's Plans for Electrification at Baltimore.—Reversing its position at the instance of the city authorities, the Pennsylvania Railroad has agreed to electrify its Calvert Street yards in Baltimore, instead of using storage electric or gas-motor equipment in that section, as at first planned. A question concerning overhead or underground transmission is still matter for negotiation, the railroad's plans for erecting its lines on 40-ft. poles above the streets of the city being strongly opposed by the Mayor and by many citizens.

"Narrow-Gage" Railroad to Be Electrified by November.—Electrification of the Boston, Revere Beach & Lynn Railroad, more familiarly known throughout eastern New England as the "Narrow-Gage," between Lynn and Boston, will be completed about Nov. 1, according to Vice-President G. W. Wells. Power for the Lynn end of the railroad will be supplied by the Lynn Gas & Electric Company and for the Boston end by the Edison Electric Illuminating Company of Boston. Contracts for furnishing motors and equipment for cars are being filled by the General Electric Company. Two substations, one in Lynn and the other at Orient Heights, will transmit power direct to the overhead trolley system, each car to be self-propelling and equipped with multiple-unit control. The railroad is expected to require 9,300,000 kw.-hr. annually, and the two substations will supply the power in parallel. The three-foot gage will be retained on the entire system, totaling 17 miles of double track. The service improvement program will cost more than $1,000,000.

Spectacular Sign for Republican Convention.—A jeweled "sunburst" depicting a huge American eagle, the emblem of the Republican party, is being erected in Kansas City for the Republican National Convention there next week. W. D'A. Ryan, director of the illuminating engineering laboratory of the General Electric Company, describes it as 19 ft. in diameter and covered with 7,500 "Novagem" jewels each about 2 in. in diameter and cut in the shape of a diamond. It was designed by J. W. Gosling of the General Electric Company. Two batteries of search-lamps will be turned on the sign at night. Its outer edge will be covered with jewels of canary yellow, next will come a circle of stars of white jewels, and over the center will be the eagle covered with white jewels on a background of ruby gems.

Newfoundlander Has Plan to Use Labrador's Water Power.—Possibility of the development of a big electrolytic steel project in conjunction with the water power available at Grand Falls on the Hamilton River, in Labrador, is emphasized by Victor Gordon, High Commissioner of Newfoundland in England, in a letter to the London *Times*. "It is an authentic fact," writes Mr.

Gordon, "that Labrador possesses a single great series of power resources which, if harnessed, could produce almost as much electricity as all the existing plants in the Dominion of Canada. Through the center of the peninsula of Labrador flows a mighty stream, the Hamilton River, and at one point in the course of the five miles it drops 200 ft. in tremendous rapids and then, with a roar audible 20 miles away, it makes a final plunge into a circular basin 315 feet below. Here is a cataract as large as Niagara, and experts have calculated that more than 4,300,000 hp. could be obtained from it." Mr. Gordon goes on to point out that there are within a radius of 75 miles in a northward direction from Grand Falls immense ore bodies of hematite, magnetite and siderite, rich in manganese, whose yield of metallic iron has been estimated as varying between 40 and 55 per cent. "There is no reason why the success which has attended the manufacture of electrolytic steel on the Italian side of the Alps should not be reproduced in Labrador," he declares.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

National Electrical Manufacturers' Association—The Homestead, Hot Springs, Va., June 11-15. S. N. Clarkson, 420 Lexington Ave., New York.
Artistic Lighting Equipment Association—Hotel Sherman, Chicago, June 11-16. G. P. Rogers, 420 Lexington Ave., New York.
Pacific Coast Division, N.E.L.A. — Hotel Huntington, Pasadena, Cal., June 12-15. S. H. Taylor, 447 Sutter St., San Francisco.
Georgia Electrical Association—Savannah, June 14 and 15. J. J. McDonough, Georgia Power Co., Dublin, Ga.
Northwest Division, N.E.L.A.—Portland, Ore., June 19-22. B. Snow, 1208 Spalding Bldg., Portland, Ore.
American Society of Agricultural Engineers—Rural electric session, Hamilton Hotel, Washington, June 19-22. Raymond Olney, St. Joseph, Mich.
Canadian Electrical Association—SS. "Richelieu" from Montreal to Saguenay and return, June 20-23. H. M. Lyster, 712 Power Bldg., Montreal.
American Institute of Electrical Engineers—Cosmopolitan Hotel, Denver, June 25-29. F. L. Hutchinson, 33 West 39th St., New York.
Association of Iron and Steel Electrical Engineers—Hotel Stevens, Chicago, June 25-28. J. F. Kelly, Empire Bldg., Pittsburgh.
American Society for Testing Materials — Chalfonte-Haddon Hall, Atlantic City, N. J., June 25-29. C. L. Warwick, 1315 Spruce Street, Philadelphia.
Empire State Gas and Electric Association—Commercial Section, Hotel Utica, Utica, N. Y., June 28 and 29. C. H. B. Chapin, Grand Central Terminal, New York.
Public Utilities Advertising Association—Detroit, July 8-12. T. P. Pfeiffer, Byllesby Engineering & Management Corp., Chicago.
East Central Division, N.E.L.A.—Cedar Point, Ohio, July 10-13. D. L. Gaskill, Greenville, Ohio.
National Electric Credit Association—Boston, July 16 and 17. F. P. Vose, 1008 Marquette Bldg., Chicago.
Wisconsin Utilities Association, Electric Section—Appleton, Wis., July 26 and 27. J. N. Cadby, 432 Broadway, Milwaukee.

# Commission Rulings

Prior Illegal Operation to Maintain Continuity of Service Not Ground for Refusing Certificate.—In granting an application from the Pacific Gas & Electric Company to supply gas under a franchise, the California Railroad Commission said that a certificate for the operation of a utility should not be denied on the ground that a private company in taking over a system previously constructed and operated by a municipality has functioned without authority for an unavoidable interim between the change of management and the subsequent formal grant of commission authority, because of the indispensable public need for the continuity of service.

Premises Astride Territorial Boundary May Be Served from Either Side.—Dismissing a complaint of territorial invasion made by the Vallejo Electric Light & Power Company against the Great Western Power Company, the California Railroad Commission said: "Where a structure or group of structures which might reasonably be considered as requiring one complete service, such as a toll house which is a necessary adjunct to a bridge, are so located as to lie across a territorial boundary of two competitive utilities, the consumer should be permitted to take service from either side of such boundary line." The complainant had held that its competitor had no right to render service on that portion of a bridge within the Vallejo company's territory. The commission, however, added: "The conditions to which this conclusion applies are to be carefully distinguished from an instance where the consumer might build his electric facilities over a boundary line established by the commission to defeat the purpose for which such boundary was established."

Capitalization of Estimated Saving by Development of Unused Water Sites Disapproved.—The Oregon Public Service Commission has for rate-making purposes ordered that the valuation of the ten utilities owned and operated in that state by the People's West Coast Hydro-Electric Corporation be fixed at $580,911. In arriving at the valuations of these properties, the commission states, it was impossible to make a finding in regard to the stocks and bonds of the corporation for the reason that neither class of securities is "currently quoted upon the market, nor does the record contain any testimony relative to their value." The commission also found it impossible to attempt to ascertain original cost data, owing to the absence of definite information relative to dates when portions of the properties were placed in service. The commission held that the consideration of possible values of water rights upon estimates based upon the capitalized estimated saving in cost of service which might be accomplished by the use of hydro-electric operation as compared with the operation of theoretical steam plants designed to produce an equivalent amount of power results in no practical value in so far as valuation of properties as a whole is concerned. "This capitalization theory," says the order, "would by its acceptance operate to deprive the community of one of its natural resources and permit its capitalization for the sole benefit of the operator. The commission cannot concede that any theory which will operate to this effect is sound in principle."

Commission Refuses to Compel Company to Pay for Putting Customers' Wires Underground.—The Massachusetts Department of Public Utilities has dismissed a petition from residents of Hyde Park to compel the Edison Electric Illuminating Company of Boston to bear the expense of placing underground the wires serving the petitioners' property on a street where the company is placing the wires underground by order of the fire commissioner. The department says: "The company is willing to do the necessary work on the customers' premises at their expense, or is willing to allow the work to be done by the customers or by any one employed by them so long as it meets the reasonable requirements of the service. The petitioners desire the work on their premises done by the company at its own expense." If additional legislation is contemplated, the department holds, there should be a provision for a public hearing by the fire commissioner on the proposed order after notice has been given to the company and to the owners of abutting property.

# Recent Court Decisions

Company Found Not Responsible for Results Following Breaking of Transmission Line by Felled Tree.—Five appeals from judgments in cases concerning the Kentucky Utilities Company, its plant engineer (Sandidge), the administrators of a farmer (Woodrum) and his son who were killed by electric shock, and the guardian of another son injured in the same accident, were heard by the Court of Appeals of Kentucky. Two of these appeals were brought by the defendant company and the others by the three plaintiffs. All were resolved in favor of the company. The farmer and his sons felled a tree so that it would fall parallel to the transmission line. In falling, a branch struck one of the wires and broke it. The accident caused the main line switch at the power house to "kick out," and consequently the farmer picked up the broken wire without injury to himself. While he was holding it the plant engineer threw the switch back, the sons rushed to their father's aid and the results just stated occurred. Damages were sought on three grounds: (1) That the transmission line was defectively constructed and not properly maintained; (2) that the act of Sandidge in reclosing the switch without investigating the cause of its opening was negligence; (3) that the company was a trespasser because it had no lawful right to maintain its line along the highway and because the line extended partly over the property line of the Woodrum farm. None of these contentions was held proved, the Court of Appeals pointing out also that the proximate cause of the accident was the victims' own action in felling the tree. Three judges, while sustaining the finding, dissented from the opinion that the plant operator's action in closing the switch without investigation was consistent with the highest degree of care, holding that the motive involved was the economic one of continuing service, which should be subordinate to that of safeguarding life. (5 S.W. [2d] 283.)*

# News About Men of the Industry

## *H. H. Barnes, Jr., Appointed Manager in New York*

H. H. Barnes, Jr., has been appointed manager of the New York district of the General Electric Company to succeed Theodore Beran, who recently retired. Mr. Barnes has for many years been a prominent figure in the district and his experience and training make him eminently fitted for his new position. He was born in New York City in 1875 and was graduated from Stuttgart Polytechnicum in Germany in 1897. He worked with Siemens & Halske, Berlin, until 1899, then as superintendent of the Mexican Electric Works, Ltd., in the city of Mexico, until 1901. He was staff engineer and manager of the engineering department of the Stanley Electric Manufacturing Company, predecessor of the Pittsfield Works, until 1907. He was then made engineer of the New York district. He also became assistant district manager in 1920, and relinquished his duties as district engineer in 1927 to devote all of his time to executive work.

*H. H. Barnes, Jr.*

Mr. Barnes is a fellow of the American Institute of Electrical Engineers, of which he was a manager from 1910 to 1913 and a vice-president from 1913 to 1915. He was a trustee of the United Engineering Society, New York, from 1912 to 1917 and from 1921 to 1926 and is a past-president of the New York Electrical Society. He is a member of the American Society of Mechanical Engineers and of the Society of Naval Architects and Marine Engineers. On Saturday evening, May 12, the New York office committee met at the Engineers Club for a welcoming dinner to Mr. Barnes.

---

William Chamberlain, since 1914 vice-president and general counsel of the United Light & Power Company, was elected president at the annual meeting of directors, succeeding Richard Schaddelee, resigned, who was elected chairman of the executive committee. Mr. Schaddelee, who was one of the organizers of the United Light & Railways Company, predecessor of the United Light & Power Company, had been general manager since 1904 and president since 1926.

Alex Dow, president of the Detroit Edison Company, sailed for Europe May 23 on the *Mauretania* for a six weeks' business and pleasure trip abroad.

J. B. Klump has been elected a director of the Central Indiana Power Company to succeed G. W. Curran on the board.

William H. Taylor was elected president of the Philadelphia Suburban-Counties Gas & Electric Company to succeed Arthur W. Thompson, who resigned to become chairman of the board. Mr. Taylor is also president of the Philadelphia Electric Company.

Philip G. Gossler, president and chairman of the board of the Columbia Gas & Electric Company, New York, sailed for Nassau and Miami on the Munson liner *Munamar* June 1 for a short stay in the South.

Dr. John B. Whitehead, dean of the School of Engineering of John Hopkins University, has consented to serve on an advisory commission appointed by Mayor Broening of Baltimore to act in a consulting and supervisory capacity over the activities of municipal agencies in connection with electrification work to be undertaken by the Pennsylvania Railroad in the city of Baltimore.

Carl N. Thomas has been appointed superintendent of distribution of the Narragansett Electric Company, Providence, R. I., succeeding S. B. Swan, who was recently promoted to the general managership of the company. Mr. Thomas joined the Narragansett organization in 1902 and has been active in its engineering development since that time. He is widely known in New England electrical circles. Ralph P. Ormsbee has been appointed assistant superintendent and Richard B. Parsons has been made underground engineer, in charge of underground transmission and distribution.

William Hunter has been appointed electrical superintendent of the Albany district of the New York Power & Light Corporation.

E. E. Arnold has affiliated himself with the Westinghouse Electric & Manufacturing Company in the capacity of mechanical engineer for special assignment. Mr. Arnold is returning to the Westinghouse interests after an absence of twenty years, having resigned in 1908 from the Westinghouse Machine Company to enter other fields of endeavor. He has a background of 30 years' experience in designing, testing, consulting and executive capacities.

## *W. S. Richhart to Manage Light and Power Department*

William S. Richhart, electrical engineer for the Indiana Service Corporation, Fort Wayne, Ind., for the past eleven years, has been named manager of the light and power division of that utility to succeed Robert L. Fitzgerald, whose resignation took effect May 1. Mr. Richhart has had a wide and varied experience in the course of his career, which has comprised academic work as well as practical engineering in both the manufacturing and central-station branches of the electrical industry.

Graduating from Purdue University in 1905, Mr. Richhart was engaged in research work at the university for approximately one year, leaving this work to become instructor of electrical engineering at the University of Pennsylvania, which position he held for five years. Following the work at the University of Pennsylvania he was employed for five years as division service engineer for the Westinghouse Electric & Manufacturing Company in the Philadelphia district. In 1916 he returned to Indiana, where he spent approximately one year as electrical engineer with the Public Service Commission of Indiana, before becoming connected with the Indiana Service Corporation as electrical engineer. Mr. Richhart is a member of the American Institute of Electrical Engineers.

*W. S. Richhart*

---

J. T. Logan has been appointed operating engineer of the Georgia Power Company, succeeding A. H. Parham.

Walter S. Wyman of Augusta, Me., was elected president of the Cumberland County Power & Light Company at the recent annual meeting as successor to Harry M. Verrill, who became chairman of the board of directors. Mr. Wyman, who is prominent in utility circles in New England, is also president of the Central Maine Power Company.

## "M.U.I.T." Issues First Report

The Massachusetts Utilities Investment Trust, or "M.U.I.T.," as it is widely known in New England, has made public its first annual report, covering operations for 1927. The trust was organized March 31 of last year and controls utilities serving 116 cities and towns in the Bay State with either gas or electricity or both, either at retail or through wholesale contracts. It has acquired from 80.03 to 100 per cent ownership of the various companies operated. The total population served is about 620,000. The trust also owns, with affiliated groups, 20,000 shares of the common stock of the Edison Electric Illuminating Company of Boston, but this is only a small percentage of the total Edison shares outstanding. Forty-six utilities are included in the trust's operations.

The gross operating revenue for 1927 was $9,851,726 compared with $9,500,157 consolidated revenue for these companies in 1926 and $8,872,631 in 1925. Net earnings available for dividends and depreciation in these years were respectively $2,658,839, $2,459,995 and $2,417,351. Last year's electric operating revenue was $7,224,014. Based on holdings as of Dec. 31, 1927, the total net income available for 1927 for dividends, depreciation and reserves was $3,085,080. Dividends on the annual basis to preferred shareholders were $1,310,581 and to minority shareholders of operating, holding and leased companies $267,507, leaving a balance for depreciation, reserves and surplus of $1,506,991. The total assets Dec. 31 last were $40,950,486. Energy sales last year totaled 147,192,570 kw.-hr. and there were 103,526 electric and 61,189 gas customers on the books.

General Electric Declares Extra Dividend.—The General Electric Company declared an extra of $1 on the common stock and regular quarterly dividends of $1 on the common and 15 cents on the special stock (par $10), all payable July 27 to stock of record June 15. For the past two years the General Electric Company has paid an extra cash dividend of $1, previously having paid extras on common stock in the form of $1 in special stock.

Standard Gas Stockholders Offered Rights.—Holders of the $4 cumulative preferred stock of the Standard Gas & Electric Company have been offered rights to subscribe to additional stock of the same class at $66 per share in the ratio of one new share for each four held. Stockholders of record June 12 will be entitled to subscribe to the new stock. The $4 preferred stock was formerly the 8 per cent cumulative preferred, the change in the dividend having been authorized in conjunction with other changes in the corporation's capital structure at a special meeting held May 16. No increase in the authorized $4 preferred will be necessary since the authorized amount of this issue was increased to 1,500,000 shares from 600,000 shares at the meeting referred to.

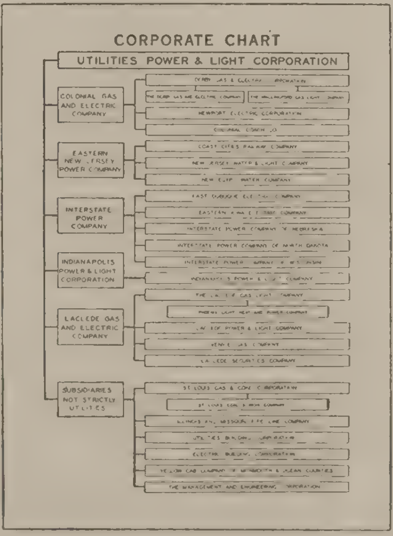
Quebec Power Offers New Shares to Stockholders.—Directors of the Quebec Power Company have voted to offer 100,000 shares of new stock to shareholders of record on May 21 at $50 a share in the ratio of one new share for four shares now held. The purchased shares will rank for dividend for the quarter ended Sept. 30, 1928.

## Southern California Edison to Redeem Bonds

All of the outstanding general and refunding mortgage twenty-five year 5½ per cent gold bonds of the Southern California Edison Company, amounting to $10,225,000, have been called for payment on August 1, 1928. This is the third time within two years that the company has availed itself of the advantages of lower money rates by refunding its high yield securities. Including the bonds presently to be retired a total of $70,644,000 of the company's underlying bonds have been retired since 1926. Upon completion of this financing the total outstanding bonds will be $123,629,700.

# Utilities Power & Light Corporation Doubles Its Size and Operations

Almost doubling in size and earnings during the past year, the Utilities Power & Light Corporation has come forward as one of the large public utility groups of the country. Total revenue increased 87 per cent, to $27,931,465; net earnings were up 80 per cent, to $13,225,213; net income accruing to parent company common stock was $2,640,034, against $2,147,915, and the company's total assets increased from $122,067,145 to $240,878,440.



CORPORATE CHART

THE MANAGEMENT AND ENGINEERING CORPORATION

Utilities Power & Light shows an interesting picture of growth during the year. Population served more than doubled, to 2,100,000, the largest growth being in the production and sale of gas. Electric customers increased from 152,996 to 230,083 and the amount of energy generated and purchased grew from 378,203,043 to 585,577,052 kw.-hr. The operating ratio increased slightly, from a low of 50 in 1926 to 52 last year. At the present time the electrical department accounts for 60.7 per cent of total business done.

Per share earnings after paying $7 on the preferred stock last year amounted to $4.44 on the average number of class A shares outstanding. At a recent price of $42 this stock is not far above ten times earnings, while the average price of holding company common stocks in the power and light industry is nearer sixteen times earnings. This, however, does not take account of class B stock. The per share earnings on the combined class A and B stock amounted to $2.13 a share. The class A stock pays $2 and the Class B $1.

### Simplifies Capital Structures

Simplification of the corporate and financial structures of the Interstate Power Company was one of the year's important operations. For a considerable period the company has been acquiring new properties and consolidating them into one system. In this process fourteen hydro plants have been put in operation and 1,980 miles of transmission and 2,219 miles of distributing lines have been constructed and placed in service. In January of last year the company simplified the structures of a large group of its companies by calling and retiring twenty bond issues which bore interest ranging from 6 to 10 per cent and twelve preferred stock issues. It also liquidated nine subsidiaries.

The report for the current year to March 31, just issued by H. L. Clarke, president, showed consolidated revenues for the corporation and its subsidiaries of $28,255,087, an increase of $344,091 over the previous twelve months. Total net income for the year was $2,884,708, after all charges, including depreciation and federal taxes, an increase of $244,674. These results do not include the operations of the Central States Utilities Corporation and the Central States Power & Light Corporation, control of which was acquired late in 1927.

## Pacific Gas Earnings Show Marked Gain

Despite a material reduction in commercial lighting and domestic rates, effective during the last month of the first quarter of 1928, earnings of the Pacific Gas & Electric Company were highly satisfactory. Gross revenue for the quarter ended March 31 amounted to $14,848,009, an increase of $668,965 over the same period of 1927. Net income was $7,027,648, a gain of $649,921. After deducting for depreciation and preferred stock dividends there remained $2,317,921 for common, a gain of $564,512 over last year. This is equivalent to 3.58 per cent on the average amount of common stock outstanding during the quarter. The company's strong financial position and decline in money rates enabled it to refund higher interest bearing issues by a 4½ per cent bond issue. This resulted in a saving in interest charges during the first quarter of 1928 of $228,002.

Commenting upon the effect of rate reductions on gross, President A. F. Hockenbeamer says: "Lower oil costs, reduced money costs and other economies will offset these rate reductions to a substantial degree. Our experience has also demonstrated that increased usage follows the lowering of rates and we anticipate that this accelerated growth, aided by an energetic sales campaign, will, within a reasonable period, compensate for loss of revenue occasioned by the lower rates."

## Two New Loans Floated by Foreign Utilities

First mortgage twenty-five year sinking fund 6 per cent gold bonds of the Brandenburg Electric Power Company (Märkisches Elektrizitätswerk Aktiengesellschaft) were issued during the past week to the amount of $5,000,000, the price being 93½ and accrued interest, to yield over 6.50 per cent. This company, its subsidiary and affiliated companies, serve a territory of over 13,500 square miles, practically the entire Province of Bradenburg, including important metropolitan districts of the City of Berlin, and certain districts in the adjacent provinces of Silesia, Grenzmark and Pomerania. These bonds, dated May 1, 1928, mature May 1, 1953. Proceeds will be used for the purpose of the further development of the existing power plants of the company, for further acquisitions, and for other corporate purposes.

The Tokio Electric Light Company, Ltd., made an offering of 6 per cent first mortgage gold bonds, totaling $70,000,000, the largest foreign financing of the present year. These securities, maturing in 1953, were priced at 90½ and accrued interest, to yield about 6.80 per cent. Simultaneous offerings are being made of £4,500,000 6 per cent sterling series in England and 60,000,000 yen in Japan, the aggregate principal amount of all three series being equivalent, at parity of exchange, to $121,809,250. The present financing provides for the payment of all existing bank loans and $41,519,400 of funded debt of the company and for additional capital expenditures.

NORTHERN OHIO POWER & LIGHT COMPANY ELECTS NEW DIRECTORS.—At a meeting of the directors of the Northern Ohio Power & Light Company H. P. Stevens and W. L. Willkie were elected members of the board of directors to succeed J. C. Weadock and E. W. Moore.

INTERNATIONAL PAPER ORGANIZATION NEARING COMPLETION.—The organization of the new International Paper & Power Company, Boston, Mass., is being completed. The company is to acquire the International Paper Company through an exchange of stock and will also purchase the holding of John R. Macomber in the New England Power Association. The International Paper Company at the present time owns 45 per cent of this stock. The terms of exchange have not been announced, but it is understood the new company will have 7 per cent preferred stock $100 par value and no par value common stock, all of which will net old stockholders of International Paper Company stock an equal income to what has been received.

POWER CORPORATION OF CANADA INCREASES STOCK.—Stockholders of the Power Corporation of Canada, Ltd., on May 11 increased the authorized common stock, no par value, from 250,000 shares (200,000 shares outstanding) to 1,000,000 shares. There are 50,000 shares reserved for conversion of the 5 per cent debentures.

LOUISVILLE MINORITY SHAREHOLDERS DENIED PETITION.—In a decision just handed down Chancellor Wolcott of the Court of Chancery at Wilmington, Del., denied the petition of a small group of minority shareholders for an order prohibiting the Louisville Gas & Electric Company from amending its charter so as to provide for removal of the call price on the class A common stock and make a change in the dividend rights of the class A and B stocks. The amendment was authorized by the stockholders at their annual meeting held in Wilmington on May 16, but by agreement between attorneys for the company and the attorneys for the minority stockholders the filing of the certificate of amendment was postponed pending the decision of the court. Holders of approximately 95 per cent of the outstanding class B stock and approximately 70 per cent of the outstanding class A stock voted in favor of the change. The certificate of amendment will be filed immediately.

| March | 1,332,752 | 1,150,008 | 1,314,812 | 1,133,785 | 17,940 | 16,223 | 135,910 | 133,702 |

## Public Service Increases Preferred Stock

Stockholders of the Public Service Corporation of New Jersey at a recent special meeting approved a resolution recently adopted by the board of directors to amend the certificate of incorporation and authorize an increase in the outstanding preferred stock from 2,000,000 to 4,000,000 shares, all the new stock being no par value cumulative preferred stock, entitled to dividends at the rate of $5 per share per annum.

## Customer-Ownership Sales

According to statistics received by the ELECTRICAL WORLD from companies taking part in customer-ownership campaigns, it is estimated that during March 172,400 shares of stock were sold, having a value of $9,720,000, in 14,500 transactions. Of this amount, somewhat more than $2,500,000 was in the form of $25 shares, the rest being sold at a price averaging very close to $100 per share.

Although this estimate may be revised upon the receipt of reports from a number of companies which were not in hand at the time the compilation was made, it is clear that there was a marked reduction in this form of financing during February and March. February sales, valued at $8,856,012, were somewhat below those of September, 1927, the last previous low month, and March sales show less than 10 per cent increase over February.

POWER IN CANADIAN MINING.—The growing use of water power in connection with mining developments in Canada is aptly illustrated in a report compiled by the Natural Resources Branch of the Interior Department. This report summarizes the location of important mining developments with the associated hydro-electric projects; it states that while no authoritative compilation of the amount of power used in the mining and metallurgical treatment of minerals in the Dominion has been published since 1924, when a total of 277,600 hp. was reported, it is probable that this figure now exceeds 400,000 hp. This involves a capital investment of approximately $75,000,000 in central electric stations for mining purposes alone.

SOUTHERN CITIES UTILITIES INCREASES PRIOR PREFERRED.—The Southern Cities Utilities Company has increased its authorized $6 prior preferred stock from 30,000 to 100,000 shares.

## Oregon Great Power State

The potential water-power resources of Oregon amount to 3,665,000 hp., as estimated from the stream flow available 90 per cent of the time, or 5,890,000 hp. as estimated from the flow for 50 per cent of the time, if storage is provided in feasible reservoir sites, according to a statement made public by the Department of the Interior based on field work and studies of the Geological Survey. Thus far only about 3 per cent of these water-power resources has been utilized; with complete development the installed capacity of waterwheels might be about 8,000,000 hp., or two-thirds as much as the present capacity of water-power installations in the whole United States.

Based on the flow available 50 per cent of the time, the estimated power within the state on certain rivers is:

|  | Horsepower |
|---|---|
| Columbia River | 1,408,000 |
| Klamath River Basin | 132,000 |
| Umpqua River Basin | 561,000 |
| Rogue River Basin | 532,000 |
| Snake River Basin | 823,000 |
| Deschutes River Basin | 734,000 |

CONSOLIDATED GAS COMPANY (BALTIMORE) PAYS DIVIDEND ON NEW STOCK.—The directors of the Consolidated Gas, Electric Light & Power Company of Baltimore have recently declared an initial quarterly dividend of 1¼ per cent on the 5 per cent preferred stock, series A, payable July 2.

CENTRAL STATES EDISON BONDS LISTED. — The Baltimore Stock Exchange has authorized the listing of $1,350,000 first lien 5½ per cent gold bonds, series A.

## *Security Issues of Electric Service Companies in May*

| Name of Company | Amount of Issue (Par Value) | Period Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Columbus Electric & Power Co. | $2,500,000 | 5 | Gold coupon notes | To retire notes | 4½ | 97.80 | 5 |
| Gulf States Utilities Co. | 2,940,000 | .. | Preferred stock | To liquidate floating debt of the company and for other corporate purposes | 5½ | 98 | 5.61 |
| Illinois Power & Light Corp. | 36,474,000 | .. | Cumulative preferred stock | To retire preferred stock | 6 | 100 | 6 |
| Puget Sound Power & Light Co. | 10,560,000 | .. | Prior preference stock | To retire preferred stock | 5 | 96 | 5.20 |
| Southern Cities Utilities Co. | 10,500,000 | 30 | First lien and collateral trust gold bonds, series A | To retire funded debt, to acquire or retire funded debt and preferred stock of subsidiaries and for other corporate purposes | 5 | 94 | 5.40 |
| Rumford Falls Power Co. (Maine) | 2,000,000 | 20 | General mortgage gold bonds | Proceeds will be used to retire maturing bonds | 4½ | 98½ | 4.60 |
| American Power & Light Co. | 19,000,000 | .. | Preferred stock, series A, stamped certificates | ........ | 5 | 95 | 5.25 |
| American Commonwealths Power Corp. | 4,500,000 | 25 | Gold debentures | For acquisition of stock and for other corporate purposes | 5½ | 96½ | 5.75 |
| American Gas & Power Co. | 6,500,000 | 25 | Secured gold debentures | To reimburse for cost of its holdings | 5 | 95½ | 5.30 |
| Public Utilities Consolidated Corp. | 1,500,000 | 10 | Secured convertible gold bonds | To retire funded debt of subsidiaries for the acquisition of additional properties and for other corporate purposes | 6 | 98 | 6.25 |
|  | 4,000,000 | 20 | First mortgage gold bonds | ........ | 5½ | 97 | 5.75 |
| Islands Edison Co. | 2,250,000 | 25 | Sinking fund secured gold bonds, series A | To purchase new company | 5½ | 96 | 5.80 |
| Indiana Electric Corp. | 3,268,000 | 23 | First mortgage and refunding gold bonds | ........ | 5 | 100 | 5 |
| Electric Public Utilities Co. | 3,000,000 | 3 | Gold notes | To retire maturing obligations and for general corporate purposes | 5 | 97½ | 6 |
| Associated Gas & Electric Co. | 2,650,000 | 40 | Gold debenture bonds | Proceeds to be used for retiring or acquiring bonds and preferred stocks of company and subsidiaries | 5 | 100 | 5 |
| Central Indiana Power Co. | 3,000,000 | 2 | Gold notes | Refunding and to reimburse for advances made or to be made to subsidiaries, for extensions and improvements | 4½ | 99.06 | 5.03 |
| Indiana Hydro-Electric Power Co. | 3,000,000 | 30 | First mortgage gold bonds, series A | To retire outstanding bonds | 5 | 99½ | 5.03 |
| Southern Cities Utilities Co. | 3,000,000 | 30 | Sinking fund gold debentures, series A | To retire securities and to acquire new properties | 6 | 99½ | 6.03 |
| Texas-Louisiana Power Co. | 1,700,000 | 14 | Gold debentures, series A | Acquisitions and improvements | 6 | 100 | 6 |
|  | 1,000,000 | .. | Cumulative preferred stock | ........ | 7 | 101 | 6.93 |

Total........ $123,342,000 (par value)
Total amount actually realized........ $120,375,100

Rights........ $1,405,700
Total financing for May........ $121,780,800

# Business News and Market Conditions

ACTIVE buying in the Eastern district, with an increase of inquiries in New England; reasonably satisfactory conditions in the Middle West, including the territory served largely from St. Louis, where the refrigerator demand is especially good—as it is also in the Southeast—and a big program of construction in California, with somewhat less cheerful reports from the Puget Sound region—this about summarizes market conditions as reported for the first part of the current week. Line material for service extensions is moving in New England. Electrical specialties in other Eastern states operate under a fair demand, though the cool weather is holding back the market for fans. May held its own well in the Great Lakes States. Meters and distribution transformers are reported from Atlanta as in active demand. Extensive street-lighting projects are under way in various cities on the Pacific Coast. Altogether, optimists find no reason for modifying their views or pessimists for applauding their own acumen.

## *Inquiries Increase in New England*

Manufacturers of New England report an increase in negotiations and a general quickening in activity in industrial equipment sales. Motor sales are well up, amounting to over $50,000 and meeting the level in volume reported a year ago. Fractional-horsepower motors are ahead of last year in sales volume. The demand for large-rating motors for loom drive and rolling operations is noted, a number, of 50-hp. and 75-hp. ratings, having been ordered during the week.

Central-station supplies are steady. According to one prominent manufacturer the demand for scheduled plant equipment, watt-hour meters, regulators, control and switch apparatus is encouraging. Two such orders for southern New Hampshire total about $8,000, one for Maine $2,000, and equipment for two Massachusetts plants $2,500. Line material for service extensions is moving. During the week two cars of material, poles, cross-arms and wire were shipped to northern New England and orders are pending for similar materials for southern Massachusetts. New constructions are heavy for residential and mercantile types. Appliance sales are at an even level as compared with last week. New projects include reorganization and installation of rayon products equipment in New Bedford, where the Delaware Company is planning extensive operations; a large laundry, to cost $300,000, at Quincy; a small refrigerator plant, $30,000, for the Cudahy Packing Company, Brockton; street signals, Boston, $250,000; Boston & Maine terminal warehouse, $3,000,000. In addition the Grafton (N. H.) Power Company has filed plans for development of 220,000 hp. (involving ultimately $40,000,000) at Fifteen-Mile Falls, adjacent to Littleton, N. H., on the Connecticut River. Other construction projects follow:

The Hartford Electric Light Company, Hartford, Conn., will make extensions in its power plant to cost $200,000. Springfield, Mass., plans an improved lighting system. The Public Service Company of New Hampshire, Manchester, N. H., will build a transmission line, 35 miles long, from Bristol to Ossipee and Conway, N. H.

## *Buying Continues Active in Eastern District*

Industrial buying is expanding in the Eastern district, with motor account developing a high level as a result of the greater variety of industries now in the market. Central-station business is satisfactory and shows signs of greater volume of commitments at an early date. A prominent manufacturer of turbogenerators and other prime movers reports contracts for equipment from two power companies in the South totaling close to $1,000,000. Metropolitan utilities continue their purchases of transformers and other substation apparatus for early delivery. A manufacturer of switching equipment states that sales show a decline in volume for the second quarter of the year, with indications for improvement during the third quarter. A municipality in Kansas has placed an order for several 200-kva. transformer units with a Pittsburgh maker. A cement mill in Wyoming has contracted with a leading manufacturer for motor-generator sets, as well as for about 50 induction-type motors. Cold-storage and meat-packing plants have been active in the market for motors for refrigerating service, varying from 30-hp. to 50-hp. rating. Motors for oil-burner installations show a tendency to lag, following sizable business in recent weeks. Smaller motors are in good demand from the shoe machinery and sewing-machine trades.

Electrical specialties in general are operating under a fair demand. Refrigerating units for domestic service are enjoying an active call and good turnover is current. Electric fans continue sluggish and present business is far from satisfactory. Elevator business is developing an improved tone, and a leading manufacturer in the New York district reports orders from apartments and commercial buildings varying from $25,000 upward for individual installations. According to a prominent producer of marine electric equipment, the immediate outlook in this line is promising. A transoceanic steamship company has contracted with an American manufacturer for a complete electric power plant for a new vessel of 19,000 tons rating now being built in England, the order including all main propelling machinery. There are several large orders pending with railroads for electrical equipment which are expected to mature within 60 to 90 days. Immediate construction activities in the Eastern district include the following:

The New York Edison Company has plans for an addition to its substation on East Thirty-ninth Street, New York, extending through to East Fortieth Street. The Yonkers Electric Light & Power Company has filed plans for an equipment storage and distributing plant to cost about $200,000. The Packard Motor Car Company will proceed with an eight-story service, repair and distributing plant on Eleventh Avenue, New York, to cost more than $1,500,000. Buffalo is having plans prepared for a vocational school to cost close to $1,000,000. The American Encaustic Tiling Company will build an addition to its plant at Maurer, N. J., to cost more than $100,000. The Public Service Electric & Gas Company will install an ornamental lighting system at Westfield, N. J. The Bureau of Yards and Docks, Navy Department, Washington, is asking bids until June 20 for ice-making and refrigerating machinery for naval air station at Lakehurst, N. J. (Specification 5423). The Quartermaster, United States Army, will rebuild and carry out expansion at the Picatinny Arsenal, near Dover, N. J., to cost about $1,500,000. Eternit, Inc., Philadelphia, manufacturer of asbestos shingles, is making plans for a new plant at Houston, Tex., to cost in excess of $1,000,000. The Pennsylvania Power & Light Company is merging 35 light and power utilities in several counties and will make extensions in transmission lines; this company will also install an ornamental lighting system at Berwick, Pa. John B. Sener & Sons, Kinzer, Pa., plan rebuilding of planing mill and lumber plant recently destroyed by fire with loss of about $100,000. Department of Public Welfare, Pittsburgh, is asking bids until June 21 for power equipment, power lines, ground lights, etc., at institution at Mayview. The Prudential Refining Company, Baltimore, will make extensions and improvements in oil-refining plant to cost more than $500,000. The Bureau of Fisheries, Washington, is asking bids until June 28 for one full-Diesel heavy-duty direct-connected reversible-type marine engine, 150 hp., for a power vessel at the Boothbay Harbor (Me.) fisheries station.

## *No Apprehension Felt in Middle West*

Comparatively good business continues in most sections of the Middle West. The slight acceleration of business noticeable at the beginning of May continued throughout the month and the consensus of opinion seems to be that May closed as favorably as could be expected. Apparently there is no reason for apprehension with regard to business conditions for the coming months, as each month of the year so far has seen some improvement. The condition of the steel, automobile, agricultural and railroad industries is encouraging, and indications seem to point to better business conditions as the year goes on. A larger amount of building construction is under way, with improved conditions among industrials and some reduction in the numbers of unemployed. The various utility companies are busy, a good deal of underground construction work going on. Maintenance purchasing was not quite so heavy this week, although the volume of business is practically the same. Jobbers' sales continue to hold up fairly well. Most appliances are moving in fair volume, with a particularly good demand noted for the smaller appliances of the gift type. The usual opening of the fan season has been delayed owing to the cool weather. Prices remain generally firm. Coming construction includes:

The Pera Pine Company, Rockford, Ill., plans a furniture-polish manufacturing plant to cost $80,000. The Southern Indiana Gas & Electric Company, Evansville, Ind., will make extensions in its power plant and system to cost $350,000. The Major Brothers Packing Company, Mishawaka, Ind., will soon take bids for an addition to cost $350,000. The Calumet & Hecla Company, Calumet, Mich., will install additional equipment at its copper properties, to cost $500,000. The Midland Steel Products Company, Detroit, plans an addition to cost $250,000. The Chrysler Motor Corporation, Detroit, plans a plant to cost $500,000. The Minnesota Power & Light Company, Duluth, Minn., will soon take bids for an equipment storage and distributing plant to cost $140,000. The Abbott Memorial Hospital Association, Duluth, Minn., will soon take bids for a power plant and a hospital addition, to cost $600,000. Wayne, Neb., will build a municipal power plant. The Seiberling Rubber Company, Barberton, Ohio, plans an addition to cost $160,000. The State Department of Public Welfare, Columbus, Ohio, will receive bids until June 14 for an ice plant at Gallipolis, Ohio, to cost $50,000. The Selby Shoe Company, Portsmouth, Ohio, plans an addition to cost $125,000. Urbana, Ohio, is considering a municipal electric light and power plant to cost $500,000. John Morrell & Company, Sioux Falls, S. D., will build an addition to their meat-packing plant to cost $250,000. The Wisconsin Power & Light Company, Madison, Wis., will soon take bids for a power plant at Janesville, Wis., to cost $100,000. The Bergstrom Paper Company, Neenah, Wis., will build an addition to its power plant, to cost $80,000. The Nekoosa-Edwards Paper Company, Nekoosa, Wis., plans an addition to cost $1,000,000. The Wisconsin Power & Light Company, Madison Wis., plans an equipment storage and distributing plant at Portage, Wis., to cost $30,000. Chicago and Lincoln, Neb., plan ornamental lighting systems.

## *Good Refrigerator Demand in St. Louis Section*

Slight change is noticed in business conditions in the St. Louis territory since the last report. No orders of contract size have been placed, but there is a somewhat better demand for stock sizes of apparatus. Unfavorable weather seems to have reduced the movement of transmission line supplies. A good volume of building construction materials is being shipped. Manufacturers of refrigerators report the demand holding up well. Coming construction includes:

The Hot Springs (Ark.) Public Utilities plans expansion in substation and distributing facilities to cost $45,000. The United States Cold Storage Company, Kansas City, Mo., plans a cold-storage plant to cost $1,000,000. The Union Electric Light & Power Company, St. Louis, plans a substation at 1408 Clark Street, to cost $35,000. The Oklahoma Gas & Electric Company, Oklahoma City, has acquired the municipal power plants at Elmore City and Calera, Okla., and plans transmission-line construction. The Western Light & Power Company is negotiating for the purchase of the municipal power plant at Woodward, Okla. The Texas Central Power Company has secured permission to build a hydro-electric power plant on the Guadalupe River, near Cuero, Tex. The Texas Utilities Company, Plainview, Tex., is planning a superpower plant to cost $750,000. Stamford, Tex., plans extensions in its municipal power plant. The Louisiana Power & Light Company, New Orleans, plans extensions in transmission lines to Ferriday and Vidalia, La., and vicinity. The Public Service Company of Oklahoma, Tulsa, Okla., will build a transmission line from Nowata to Bartlesville, Okla., and install a substation at Nowata to cost $50,000. The West Texas Utilities Company, Abilene, Tex., plans a 10-mile 6,600-volt transmission line from Wellington to Dodsonville, Tex. The Texas Electric Service Company, Dallas, Tex., will build a 60,000-volt transmission line between McCamey and a point near Chalk Oilfield, in the vicinity of Big Springs. Dallas, Tex., plans an ornamental lighting system on the Fort Worth-Dallas Pike.

## *Pacific Coast to See Extensive Construction*

Much large construction has just been announced in California. The Carquinez Straits train ferry, operated by the Southern Pacific Railroad since 1869, is to be replaced by a ten-million-dollar bridge 1¼ miles long with an electrically raised lift span to be 135 ft. above water level. A half-million-dollar glass factory is to be built at Vernon, and a Pittsburgh plate-glass concern is to build a plant in South San Francisco. Ecclesiastical construction includes $1,000,000 to be spent on the Sacred Heart Academy in Los Angeles, $300,000 for the Holy Cross Hospital in Fresno, $500,000 for a Los Angeles synagogue, and a drive is now on in San Francisco to get funds for the Episcopal Cathedral there, which will cost $3,500,000. School construction includes new high schools and additions for Placerville, Redwood City and Inglewood, averaging $400,000 each, while Alhambra has raised $1,400,000 for junior and senior high-school systems. Street-lighting projects include Tulare, with 28 single standards, awarded at $6,000; Torrance, estimated at $110,000; 116 standards for seventeen blocks in Bakersfield, awarded at $28,000; a system for San Leandro, estimated at $20,000; a duplex-light extension to the San Jose system and a single-light extension to the Sacramento system. Miscellaneous large construction includes a 300-kw. unit plant for the city of Alturas, the new Morgan Hill substation for the Pacific Gas & Electric Company, containing four transformers of 11,000 kva. each; an addition to a South San Francisco steel plant containing a 225-hp. synchronous motor and accessories; a market for Oakland to cost $750,000; the half-million-dollar Parr terminal in Richmond and a hotel for Tiajuana, estimated to cost $750,000.

General let-down in business is being experienced in the Puget Sound district with no definite explanation as regards the reason. However, indications for summer business are said to be comparatively bright, with orders of considerable magnitude in the immediate offing, these to emanate from lumber-mill and pulp and paper manufacturing sources. Last week's volume included about 80 small motors, from 100 hp. down, for pumping plants, cold-storage and lumber mills. Seattle's building permits for the first five months of the year show an increase in excess of $4,000,000 over the like period last year. Coming construction follows:

The Southern California Edison Company, Los Angeles, plans a substation on Madrid Street, Torrance, Calif. Idaho Falls, Idaho, is arranging bonds for $100,000 for a hydro-electric power plant on the Snake River. Nashua, Mont., plans a transmission line to connect with system of Montana Power Company at Glasgow, Mont. The Rocky Mountain Power Company, Butte, Mont., has applied for permission to build a hydro-electric power plant on the Flathead River, near Polson, Mont., to cost $1,000,000, with transmission line. Tacoma, Wash., plans a transmission line from the municipal power development at Cushman to Nisqually substation to cost $63,000. The Grays Harbor Pulp & Paper Company, Hoquiam, Wash., will build a transmission line from its power plant to the East Hoquiam Valley section. The National Paper Products Company, San Francisco, plans a unit at the Kraft paper mill at Port Townsend, Wash., to cost $1,500,000. The Moreland Truck Company, Los Angeles, is planning a motor-truck assembling plant at Seattle to cost $100,000. Sellers & Stone, Yakima, Wash., plans a cold-storage plant to cost $100,000. Cardiff, Monrovia and Pasadena, Calif., plan ornamental lighting systems. Santa Ana, Calif., plans an ornamental lighting system to cost $100,000.

## *Quiet Market with Active Spots in Southeast*

Activities in the electrical field in the Southeast have been quiet during the past week, a reasonable volume of business having been sustained by small-size orders. There is a more active demand for meters and distribution transformers, the largest individual transformer order last week coming from Mississippi and amounting to $15,000. In the past ten days one power company has ordered switching equipment totaling $10,000 and creosoted pine poles amounting to $5,300. Some other central-station orders include line construction materials amounting to $5,000, distribution transformers at $3,200 and metal conduit at $3,000. One of the larger power companies has sold $391,000 of electric refrigerators in the past 27 selling days, with the campaign to run 26 days longer. Another of the larger companies is this week getting under way with a large refrigerator campaign and has just completed an electric range campaign in which 1,115 ranges were sold in 40 working days.

Building permits in Atlanta for May amounted to $5,800,000, which is the highest monthly total in the city's history. Municipalities are ordering in less volume than has been the case in recent months, though one town ordered last week one carload of creosoted pine poles and another town is in the market for "white way" equipment costing in the neighborhood of $10,000. A town in Louisiana ordered in the past few days "white way" equipment amounting to $7,000. Such equipment is in active demand over the territory generally, but the individual orders are averaging only $1,000 each. New projects include:

Swift & Company, Chicago, will build a lard plant at Jacksonville, Fla., to cost $250,000. The Georgia Manganese & Iron Company, Hurt Building, Atlanta, plans a plant at Cartersville, Ga., to cost $1,000,000. Quartermaster, Fort Benning, Ga., will receive bids until June 15 for insulators, switches, reflectors and other electrical supplies (Circular 97). The Lexington (Ky.) Utilities Company is arranging for the purchase of the Georgetown (Ky.) Water, Gas & Electric Power Company. The Adrian Knitting Mills, Dyersburg, Tenn., plan a mill unit to cost $125,000. The Arrington Cold Storage Company, Arrington, Va., will build a cold-storage plant, to cost $200,000. The East Coast Utilities Company, Richmond, Va., will make extensions in the transmission lines in Matthews County. New Martinsville, W. Va., has voted bonds for $125,000 for a municipal light and power distributing system. The Universal Glass Products Company, Parkersburg, W. Va., plans an addition to cost $150,000. Greenville, Miss., plans a municipal light and power plant. The Mississippi Power Company, Gulfport, Miss., will make extensions in its ornamental lighting system at Meridian, Miss., to cost $35,000. The Stowe Thread Company, Belmont, N. C., plans a mill unit to cost $100,000. Corinth, Miss., and West Palm Beach, Fla., plan ornamental lighting systems.

### *Copper and Lead Active at Unchanged Prices*

The week ended Wednesday was characterized by better than average volume of sales of lead and copper, with substantially the same prices as obtained a week ago. Zinc continues dormant, also with practically no change in price.

NEW YORK METAL MARKET PRICES

| | May 29, 1928 Cents per Pound | June 6, 1928 Cents per Pound |
|---|---|---|
| Copper electrolytic..... | 14.525 | 14.525 |
| Lead, Am. S. & R. price. | 6.30 | 6.30 |
| Antimony............. | 11.0 | 10.50 |
| Nickel, ingot........... | 35 | 35 |
| Zinc spots............. | 6.475 | 6.487 |
| Tin, Straits............ | 50.625 | 49.50 |
| Aluminum, 99 per cent. | 24.30 | 24.30 |

Base copper wire price June 6, 1928, 16⅝ cents.

Both tin and silver are lower, prompt Straits tin having been continuously below 50 cents for the first time in four years. The reaction in silver to close to 60 cents is perhaps only natural after the recent rapid advance.

# Activities of the Trade

## Berger Brothers Buy Motor Department in Toledo

The purchase of the motor department of the Lake States General Electric Company, formerly the Nagle Electric Company, of Toledo, Ohio, is announced by Berger Brothers, 91 St. Paul Street, Rochester, N. Y. The motor department will be located at the same address, 34 St. Clair Street, Toledo, and will operate under the name of the Fred W. Kiemle Company. The business will be conducted in the future, as it has been in the past, under the supervision of Mr. Kiemle, who is vice-president and general manager. It is said that the affiliation with Berger Brothers will permit the handling of purchases and sales of used equipment on a much larger scale than in the past.

Berger Brothers also announce that after Sept. 1 they will be located in a new and larger plant at 1350 University Avenue. At the new plant the company will have 35,000 sq.ft. of floor space and every modern facility, including craneways, cranes and larger railroad sidings.

## Dudlo Manufacturing Adopts New Shipping Method

Instead of shipping wire on spools, with the consequent higher shipping cost and the necessity of handling and returning empty spools, the Dudlo Manufacturing Corporation, Fort Wayne, Ind., has developed the Dudlo demountable spool. The wire is properly spooled at the mill, tied, removed from the spools and shipped in condition for unspooling by the customer through the use of the demountable spool. The company claims a number of advantages for this method of handling, including the release of capital tied up in spools and the reduction of handling costs.

The Automatic Electric Heater Company, 1505 Race Street, Philadelphia, is now offering its "Sepco" line of water heaters in colors to meet the present-day trend of color in the home.

The Delta-Star Electric Company, 2400 Block, Fulton Street, Chicago, manufacturer of high-tension equipment, announces that it is now offering a new line of unit type low-voltage spool-insulating supports.

The American Transformer Company, Newark, N. J., announces the appointment of the following district representatives: L. C. Herrmann, 4433 North Richmond Street, Chicago; H. C. Boulton, 1988 East 66th Street, Cleveland; Congleton Engineering Company, 914 Main Street, Cincinnati; Herr-Harris Company, 910 Fulton Building, Pittsburgh; L. D. Joralemon, 112 South Sixteenth Street, Philadelphia; W. O. Taylor & Company, Ltd., 415 Canada Cement Building, Montreal, Canada; Elliott Equipment Company, 708 Sixth Avenue, South, Minneapolis, Minn.; Arthur L. Pollard, Knoxville, Tenn.; James H. Southard, 682 Mission Street, San Francisco, and J. W. Jones, 432 Pennant Building, St. Louis.

The C. O. Bartlett & Snow Company, Cleveland, manufacturer of material-handling equipment, announces the appointment of J. R. Allison as its representative in Pittsburgh with headquarters at 406 Bessemer Building. Mr. Allison was formerly with the Carnegie Steel Company in the construction department of the Homestead Steel Works of that company.

The Botfield Refractories Company, Swanson and Clymer Streets, Philadelphia, manufacturer of "Adamant" firebrick cement, announces that since June 1, the distribution of its products in Toledo, Ohio, and vicinity has been handled by the Builders' & Industrial Supply Company, 4090 Detroit Street, Toledo, Ohio.

The Ingersoll-Rand Company, 11 Broadway, New York City, has received an order for three oil engines for use in connection with three 300-hp. oil-electric locomotives which are being built jointly by the Ingersoll-Rand Company, the General Electric Company and the American Locomotive Company. These locomotives are being built for the Ashland division of the American Rolling Mill Company.

The Northern Engineering Works, Detroit, manufacturer of cranes and hoists, has appointed the Interstate Supply Company, Commercial Trust Building, Philadelphia, as direct factory representative for the Philadelphia district. W. H. Beyer of the latter company, formerly connected with the Philadelphia office of Manning, Maxwell & Moore, will be in charge.

The Philadelphia Electrical & Manufacturing Company, 1228 North 31st Street, Philadelphia, has placed on the market the "Pemco" electric water heater, in which the current passes directly through the cold water. For normal use a single-plate electrode takes the load, while for large load demands a second set of electrodes goes into action automatically. The manufacturer claims high efficiency for this method.

The Westinghouse Electric & Manufacturing Company has appointed J. K. B. Hare as assistant central-station sales manager of the company. He will be associated with G. E. Wearn, central-station sales manager, and will have his headquarters at the company's office at 150 Broadway, New York City. Mr. Hare has been with the Westinghouse interests for the past sixteen years, with the exception of two years of army service during the war.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued May 15, 1928)

1,669,515. Current Transformer; J. B. Gibbs and G. A. Burr, Wilkinsburg, Pa. App. filed Sept. 6, 1923. For outdoor use.

1,669,516. Automatic Reclosing Circuit Interrupter; L. R. Golladay, Wilkinsburg, Pa. App. filed Nov. 2, 1921.

1,669,518. Elevator Control System; R. P. Higbee, Wilkinsburg, Pa. App. filed May 24, 1923.

1,669,519. Measuring Device; F. W. Hild, Los Angeles, Calif. App. filed Jan. 25, 1923. For use in connection with control systems for oil-well, and other earth drilling and similar operations.

1,669,520. Thermal Relay; H. D. Hineline, Pittsburgh, Pa. App. filed Feb. 3, 1923. Cartridge type.

1,669,521. Theater Dimmer and the Like; R. B. Hunter, Milwaukee, Wis. App. filed Nov. 26, 1923.

1,669,522. Turbine-Governing System; W. Innes, Monkseaton, England. App. filed Aug. 3, 1923.

1,669,524. Speed-Control System for High-Frequency Generators; S. M. Kintner, Pittsburgh, Pa. App. filed Nov. 2, 1921.

1,669,527. Method of and Apparatus for Producing Modified Currents, Etc.; F. W. Meyer, Schenectady, N. Y. App. filed Feb. 1, 1918.

1,669,529. Insulator; F. H. Miller, Wilkinsburg, Pa. App. filed Sept. 19, 1922. High-potential insulator of the suspension type.

1,669,531. Electric Switch; A. J. Mottlau, Pittsburgh, Pa. App. filed April 9, 1927. Quick-break-and-make type.

1,669,544. Thermal Control Device; C. Aalborg, Wilkinsburg, Pa. App. filed Sept. 3, 1919.

1,669,545. Switch; C. Aalborg, Pittsburgh, Pa. App. filed July 31, 1924. For use in the handles of vacuum cleaners.

1,669,546. Circuit Interrupter; C. Aalborg, Pittsburgh, Pa. App. filed Feb. 12, 1925. High-speed.

1,669,548, 1,669,549. Electrical Fixture-Supporting Device; R. B. Benjamin, Chicago, Ill. Apps. filed July 1 and 23, 1921.

1,669,558. Motor-Control System; W. L. Hartzell, Pittsburgh, Pa. App. filed Sept. 12, 1921. Employed in the drilling of oil wells.

1,669,560. Utility Drive; W. H. Himes, Pittsburgh, Pa. App. filed Feb. 18, 1925. Power drive for implements.

1,669,564. Burglar-Alarm System; W. E. Jones, Hennepin, Minn. App. filed May 15, 1920.

1,669,570. Terminal Cover; W. G. Mylius, Wilkinsburg, and B. G. La Bar, Turtle Creek, Pa. App. filed Nov. 14, 1925.

1,669,572. Electrical Measuring Instrument; C. Oman, Swissvale, Pa. App. filed Feb. 3, 1925. Polyphase induction watthour meter.

1,669,576. Rotary Phase Converter for Converting Alternating Current; M. Schenkel, Berlin-Charlottenburg, Germany. App. filed July 23, 1925.

1,669,577. Frequency Converter of Asynchronous Construction; M. Schenkel, Berlin-Charlottenburg, Germany. App. filed July 23, 1925.

1,669,582. Temperature-Control System; S. A. Staege, Pittsburgh, Pa. App. filed July 23, 1925. For controlling the temperature of a dryer unit.

1,669,588. Electric Heater; E. G. Burns and J. A. Davis, Sacramento, Calif. App. filed Nov. 3, 1925.

1,669,608. Thermostatic Switch; F. F. Forshee, Mansfield, Ohio. App. filed May 29, 1926.

1,669,609. Regulator System; C. LeG. Fortescue, Pittsburgh, Pa. App. filed March 18, 1925. For regulating the excitation current of dynamo-electric machines.

1,669,619. Electric Meter; A. J. Lush, Waltham, Mass. App. filed April 9, 1925. Of the double-pivot type.

1,669,626. Automatic Cut-Off Plug for Electric Irons; B. F. Ordway, Pasadena, Calif. App. filed Sept. 9, 1925.

1,669,660. Welding Rod; J. Birchard Green, Chicago, Ill. App. filed March 19, 1926. For metallic arc welding.

---

Information on foreign patents can be obtained through the nearest district office of the Bureau of Foreign and Domestic Commerce, Department of Commerce.

1,669,661. Coated Filler Material; J. B. Green, Chicago, Ill. App. filed Feb. 28, 1927. For fusion welding and cutting by the arc process.

1,669,666. Electrical Wall Socket; H. F. Laub, Logan, Utah. App. filed July 3, 1923.

1,669,687. Rheostat-Arm Mount; H. E. Adams and H. L. Decker, Toledo, Ohio. App. filed July 16, 1926. Liquid lever indicators of the type having a float actuated rheostat.

1,669,702. Fuse Box; A. F. Euchenhofer, Dayton, Ohio. App. filed Oct. 21, 1920.

1,669,719. Conductor Suspension Apparatus; J. R. Marshall, McKean, Pa. App. filed Oct. 5, 1925.

1,669,770. Time Switch; J. C. Miller, Oak Park, Ill. App. filed Dec. 24, 1925.

1,669,773. Electrically Heated Bathtub; K. H. Ober, Baltimore, Md. App. filed April 13, 1926.

1,669,802. Electric Stove; C. C. Armstrong, Huntington, W. Va. App. filed Aug. 3, 1925.

1,669,849. Cigar Lighter; C. Baia, West New York, N. J. App. filed Aug. 4, 1925.

1,669,938. Vertical Pump Motor with Top Adjustment; C. E. Johnson and E. Mendenhall, Los Angeles, Calif. App. filed July 2, 1925.

1,669,964. Electrical Water Heater; B. Barry, Mount Eden, Auckland, N. Z. App. filed June 19, 1926. In which heating element containers are inserted into a water circulating container.

1,669,972. Reciprocating-Bed Printing Press; C. B. Cottrell, 3rd, Westerly, R. I. App. filed July 9, 1924.

1,669,995. Water Purifier; W. M. Myers, St. Joseph, Mo. App. filed May 28, 1927.

1,670,009. Contact Clamp; P. A. Sawyer, Hasbrouck Heights, N. J. App. filed April 9, 1925. For use in connection with lead-in or ground wires as applied to telephone or wireless telephone connections.

1,670,030. Nonsynchronous Motor; V. A. Fynn, St. Louis, Mo. App. filed July 5, 1924. Improvement or control of the power factor or to the compensation of such motors.

1,670,031. Synchronous Motor; V. A. Fynn, St. Louis, Mo. App. filed Oct. 22, 1926.

1,670,032. Electric Water Heater; A. J. Gibbons, Indianapolis, Ind. App. filed June 5, 1926.

1,670,040. Dry Cell; E. H. McCabe, Madison, Wis. App. filed Dec. 22, 1924.

1,670,046, 1,670,047. Battery Plate and Method of Making Same; W. J. Plews, Detroit, Mich. Apps. filed June 27, 1921 and Dec. 29, 1927.

1,670,052. Electrode Mass for Self-Baking Electrodes; C. W. Soderberg, Oslo, Norway. App. filed July 22, 1924.

1,670,063. Load-Control System; A. G. Darling, Schenectady, N. Y. App. filed June 30, 1926. Which permits the plant to fully utilize the waste heat energy in certain forms of cheap fuel resulting as a by-product from industrial operations, in the generation of motive fluid for the prime movers, while the plant is interconnected with other sources of electrical energy in a power supply system.

1,670,073. Rotary Snap Switch; L. A. Kempton, Bridgeport, Conn. App. filed Dec. 16, 1926.

1,670,075. Cloth or Fabric; T. H. McComsey, Los Angeles, Calif. App. filed Aug. 18, 1925. Adapted for use in the manufacture of electro-magnetic therapeutic devices such as blankets, pads, garments and the like.

1,670,081. Induction-Motor-Control System; W. Seiz, Baden, Switzerland. App. filed April 16, 1926. Which will enable the induction machine torque to be controlled independently of speed.

1,670,083. Turbine-Regulating Means; R. G. Standerwick, Marblehead, Mass. App. filed April 20, 1927.

1,670,088. Electric Switch; L. S. Walle, Scotia, N. Y. App. filed Dec. 31, 1923. For reverse current or normal overload, the tripping of the switch being effective regardless of the position of the switch closing mechanism.

1,670,089. Flow Meter; J. Walsh, Swampscott, Mass. App. filed Nov. 5, 1926. With compensating means.

1,670,091. Electrical Receptacle Construction; R. B. Benjamin, Chicago, Ill. App. filed March 9, 1923.

1,670,093. Control System; H. Bany, Schenectady, N. Y. App. filed June 17, 1924. For effecting a desired connection, such as a connection between the field winding of a synchronous machine and a suitable source of excitation, when a synchronous machine reaches synchronous speed after being started.

1,670,121. Circuit Breaker; E. D. Moore, Cleveland, Ohio. App. filed July 23, 1924.

# New Trade Literature

UNIT PULVERIZER.—The Riley Stoker Corporation, Worcester, Mass., has issued a catalog which describes and illustrates the new improved "Atrita" unit pulverizer and gives information on the reliability, low maintenance, ability to handle wet coal and the sustained fineness of pulverization. The new Riley flare type burner also is described and illustrations are given showing many installations of the unit pulverizer.

REFRACTORIES. — Technical bulletin No. 20 issued by the Crescent Refractories Company, Curwensville, Pa., contains notes on the design of fire-clay shapes. Technical bulletins 1 to 19 inclusive, which contain charts, formulas and simple rules compiled for the use of persons interested in refractory linings also are available.

SHOP EQUIPMENT. — The Hobart Brothers Company, Troy, Ohio, is distributing a catalog covering the HB shop equipment, including the eight-hour battery chargers, electrical testing equipment, upright automatic air service, spray painting equipment, hydraulic car washers and ball bearing buffers and grinders.

PLUGS AND RECEPTACLES. — The Crouse-Hinds Company, Syracuse, N. Y., is distributing bulletin No. 2111, covering its type BP plugs and several types of plug receptacle condulets.

MOTORS.—Bulletins 504, 505, 506 and 502-A issued by the Louis Allis Company, Milwaukee, describe and illustrate respectively its slip-ring induction motors, its polyphase squirrel-cage motors, its single-phase squirrel-cage condenser motors and its inverted rotary converters. The bulletins cover the construction features. A number of illustrated applications are shown.

REFRIGERATOR CABINETS.—The Benjamin Electric Manufacturing Company, 128 South Sangamon Street, Chicago, is distributing a portfolio entitled "Building up Profits in Electric Refrigeration with Benjamin All-Porcelain Cabinets and the 1928 Sales Profit Plan." This portfolio describes a step-by-step method of building up a prospect list, the preparation of direct-by-mail and newspaper advertising, the development of sales follow-up, and presents an actual exhibit of the advertising material prepared by the Benjamin company for its distributors and dealers to use in selling all-porcelain cabinets for electric refrigeration. The company also has issued a catalog describing and illustrating its new line of all porcelain cabinets for electric refrigeration for apartment house installation.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase is desired in Sydney, Australia (No. 31,526), of hard-rubber battery containers, covers and vents.

An agency is desired in Luebeck, Germany (No. 31,533), for diaphragm sheets for telephones, loud speakers, etc.

An agency is desired in Munich, Germany (No. 31,531), for electric hand and hair driers.

Purchase or agency is desired in Gruenberg, Germany (No. 31,525), for electric hand driers.

An agency is desired in Mannheim, Germany (No. 31,528), for electrical hot-air drying apparatus, motor-driven household electrical appliances and electric washing machines.

An agency is desired in Dresden, Germany (No. 31,532), for electrical hot-air drying apparatus, and another (No. 31,504) for electric portable tools.

Purchase is desired in Amsterdam, Netherlands (No. 31,524), of electric floor polishers and electric washing machines.

An agency is desired in Port au Prince, Haiti (No. 31,522), for household electrical appliances and electric refrigerators, and another (No. 31,523) for household electrical appliances and electric refrigerators.

An agency is desired in Bradford, England (No. 31,536), for colored porcelain lighting fixtures and vacuum cleaners.

## *Unfair Conduct of the Utility Investigation*

DISTORTION of the acts and motives of the various committees on public utility information by the Federal Trade Commission and its serious reflections on the electric light and power industry suggest the desirability of a radical change in the conduct of the hearings being held in Washington. No man should be subjected to the kind of examination meted out by the commission without also being heard in his own defense. Common justice demands it, and the public utilities should see to it that the men summoned to testify are not cast to the lions, but have their rights defended by competent counsel.

Enough has already developed in these Federal Trade Commission hearings to indicate that an inquisition is being conducted and that the commission is both judge and jury in the case. Justice may in the end prevail, but meanwhile innocent persons are being maligned and an outstanding and public-spirited industry, smeared with the vilest calumny. Must this be endured in the United States? Is there none to say, "Enough of this malicious misrepresentation"? Shall the rights of citizens be denied them by a federal bureau? It is time to administer a rebuke and time also for the public utility industry to contend boldly and resolutely for its right to defend itself against being forced into the position of a criminal from whom confession is extorted when its real attitude is that of a candid witness with nothing to conceal, eager and unafraid to publish the truth.

* * * *

## *Duty of Engineers to Go to the Aid of Congress*

POCKET veto of Muscle Shoals and the failure of Congress to pass on Colorado River except to make provision for an examination by an engineering board may be accepted by the electric light and power industry as a respite, but the situation is far from that. Granting that a board of high-grade and impartial engineers is appointed to pass on the plans for the Colorado River dam at Boulder Canyon—and the industry asks for nothing more—the Swing-Johnson bill with all its menacing features will be up again for consideration next December. Its passage or defeat then will depend somewhat on the report of the engineering board, but also on the attitude of the country toward the proposition of government in business. Hence the importance of painting and keeping ever before the eyes of the public, and especially of industry, a picture of what government in business means.

With reference to Muscle Shoals, the evident incompetency of the government to handle the development satisfactorily should cause the electric light and power industry some concern. Between now and December an effort should be made to find a workable solution of the problem which has perplexed Congress so long. True, Congress has not shown much ingenuity or flexibility in its handling of Muscle Shoals legislation; but why expect economic or engineering sense from legislators? It is the duty of those who are expert in such matters to help Congress toward a solution, and inasmuch as Muscle Shoals has resolved itself into a power development, the obligation to help lies heavily on the power industry. Congress having tried and failed, our engineers and executives should unselfishly show it the way.

* * * *

## *Friendly Neighbors*

THE secret of good public relations lies in the Golden Rule. It is unreasonable for any business organization to expect the members of a community to be friendly and of an understanding and patient spirit if it does not make a sincere and consistent attempt to be neighborly with them. To have friends a man must prove himself friendly. He must, if he is to be widely welcome, possess a sincerely responsive personality. There is no hidden charm or fetish about public esteem, nor is it likely to be acquired through an excess of conscious effort. Our friends often admire us for qualities not knowingly possessed or cultivated.

Utility-owned tracks and buses that hog the road, metermen who are tongue-tied before civil questions, linemen who endeavor to prove the possession of "hard-boiled" characteristics, and elevator starters whose brains are subject to unconscionable delay in replying to a customer's inquiry, have no place in building friendships. Electric light and power companies serve many masters of high and low degree, but they should never forget that human nature is so formed that individuals seldom resent the compliment of being treated as though they were a bit better, a bit more intelligent, a bit wealthier, a bit more influential than they really are—or if you prefer—than you think them to be.

* * * *

## *The Association's Pledge in Aid of Research*

ACTION by the National Electric Light Association at Atlantic City last week whereby it virtually pledged itself to contribute three million dollars for pure research indicates the public spirit and broad-mindedness of that body. In the face of the charge that they seek to pollute public instruction by bribing professors to teach untruths about the public utility business or to write what is not so regarding municipal or government ownership, the utilities turn the other cheek.

Favorable action on research was taken by the National Electric Light Association before the present investigation of public utilities was started or even suggested. The fund will be dispensed by the National Research Council of Washington, which body, we understand, will make allotment to the universities and colleges of the country interested in pure science research. Thus the electric light and power industry will have no control over the fund or the work to be done with it, but it will benefit with all other industry and with the country at large from the discoveries that result from the research thus made possible. These benefits are too great and too patent to any thoughtful man to leave room for cavilers to dispute the value of the association's large-visioned pledge.

* * * *

## *Electrical Wholesalers Take a Step Forward*

AT LEAST the beginning of a more progressive policy is seen in the action that was taken last week at Hot Springs, Va., at the annual convention of the jobbers. They changed the name of their organization to the National Electrical Wholesalers' Association and they appointed a managing director. This realigns this organization in conformity with the other national associations of the electrical industry and also serves to emphasize the fact that the "jobber" is not a mere middleman but performs a function that is inescapable in the flow of the products of the factory. As Chairman Cullinan pointed out, the "jobber" does not merely buy and then resell. He warehouses and distributes. Some one must do this. The manufacturer may, if he will, assume this function in addition to that of production, or it may be put into the hands of the wholesaler, who is a specialist. But the services of wholesaling and distributing must be performed if the goods are to be made available to the local trade and to the consumer. Whoever performs this function, it costs money.

What are the economics of the case? The industry in general does not know and the burden of proof naturally rests upon the wholesaler. Here obviously is work for the N.E.W.A. to do that the manufacturer, the installer and the retail trade may know that distribution as organized in the electrical industry is orderly and efficient. And there are other problems, particularly concerning the wholesalers themselves, to which the reorganized association can well direct its attention. Employee insurance, employee stock ownership, cost of trucking—there are many such issues on which light is needed, as was pointed out by McKew Parr in discussing the opportunity for a broader service to the membership. The class relations of the wholesalers with the other organized branches of the industry also present many questions of pressing importance, such as excess warehousing by central stations and the tendency of many manufacturers to bypass their own jobbers on large orders. How can the wholesalers' service be made proof against this? It is apparent, too, that the jobbers now lack the close contact with the organized industry needed to keep the wholesaler in intimate and sympathetic touch with national trends. Here also the N.E.W.A. can help.

Undoubtedly there was at this meeting a much better spirit of harmony between the independent group of jobbers and the so-called "big three," meaning the houses affiliated with the Graybar, General Electric and Westinghouse companies. This, of course, is vital to the development of a constructive program. For what the wholesalers need most today are clear-cut industry purposes and well-defined policies based on the economic facts of distribution.

* * * *

## *System Economy More Important than High Unit Economies*

A NEW thought is cropping out in the electric utility field which may seem old because utility companies thought they were achieving the result at which it aims by old methods. This thought, as expressed by H. P. Liversidge of the Philadelphia Electric Company, is that the industry is "not aiming to build generating stations with the highest individual economy but is seeking the best system economy."

As any company can judge for itself, erecting a new station with record economy does not improve the system generating economy much if there are a number of greatly inferior stations on the system. Likewise, erecting the most economical transmission lines in the country does not necessarily bring up the entire transmission and distribution economy greatly. Still, much construction in various parts of the country has been characterized by concentration on the economy of new units, stations and lines installed.

The recent trend has been toward more moderate capital expenditures for high economy in new components of a system and apportionment of the money which could be invested for super-economy in new units among old components for rehabilitation that will bring the best system results. By following this procedure and not forgetting that distribution losses quickly offset economies in generation, one company has brought its system economy to the unusual value of 19,000 B.t.u. per kilowatt-hour sold. The analysis of twenty-five large systems in the issue of the Electrical World for January 8, 1927, would indicate that many companies have given more thought to the economy of new stations than to system economy.

* * * *

## *Electricity and the Human Body*

IF ELECTRICITY can have performed so many remarkable services in lightening labor, if it can have raised the standard of living throughout the world, must we continue to say that it is impotent in repairing bodies and in keeping them in repair?

Not for long, certainly. Electrotherapeutics has passed the stage of charlatanism and magic and has settled down to sober and honest progress. The alluring but entirely fictitious powers of "electronic reactions" and all their breed have been exploded and electricity has at last taken an active hand. Chemistry, once the only reliance of medicine, has a new and powerful ally whose purpose, like that of its colleague, is sound investigation and reproducible results. Ultra-violet light from electrical sources, far more powerful than sunlight and yet more controllable, has already gained a substantial reputation in medicine. It is conceded to be a cure for rickets, a powerful assistant in the treatment of tuberculosis and a bactericidal agent of great value in surface infections. It is also receiving much attention as an active force in the production of the still mysterious vitamins in foods. X-rays, thanks to the intensive developmental work done by science, are now under effectual control and with each new advance in the art of their production they are finding new applications in the war against disease and disability. At first their value lay principally in their great assistance in medical diagnosis, but they are now the basis of a complete new therapy, having well established uses in the treatment of certain kinds of cancer and kindred ailments.

These two—ultra-violet light and X-rays—are already firmly established. But there are other electrical phenomena that may soon serve the doctor in his fight for men's bodies. High-frequency currents, whose curative power has been in dispute for years, are now being suggested in medical circles as a possible means of aiding natural convalescence by producing artificial fevers. And recently has come the announcement of the cathode-ray tube, which can produce many hundred times more radiation than is given off by all the radium in the world and, unlike that rare metal, is under perfect control. Neither doctor nor scientist can say at present what the cathode ray may do for medicine, but it is quite possible that great benefits may come from it.

These are a few of the contributions and the promises which electricity, turning from the remodeling of industry, has made to man himself. Research in its unending perseverance, supported by an open public mind, may turn these promises to realities, and it may reasonably be hoped that pain and suffering will steadily decrease throughout the world.

* * * *

## *Follow Through in Plant Betterment*

A HOMELY adage about putting one's hand to the plow and keeping on to the end of the furrow without turning back deserves consideration in power-plant betterment work in cases where a transfer of ownership results in new management. Few, if any, utility systems are ever finished, and almost invariably the acquisition of a property by a new group of investors finds improvements of greater or less importance under way in plant and field. The temptation to save money at every possible turn is often very strong upon a new management, and this often means a temporary slowing down of outlays for betterment which actually should be followed through in order to realize the best service and the lowest unit costs of operation in the long run.

It seems incredible that economically justified work should be curtailed, if not stopped entirely, by a new régime which is overanxious to make a better showing financially for the first year or so than did its predecessor; but such practice is by no means imaginary. To stop the installation of an automatic electrical control system, for instance, upon which perhaps $2,000 has already been expended and which might be completed for $500 more, may lengthen the period of risk associated with manual operation and perhaps do great harm in an emergency. Certainly one of the earliest engineering jobs to be done in taking over a plant should be a thorough check of all unfinished construction work, and if it appears that the previous management made a sound decision in starting it and carrying it forward, only the most convincing reasons should be allowed to interfere with its completion.

* * * *

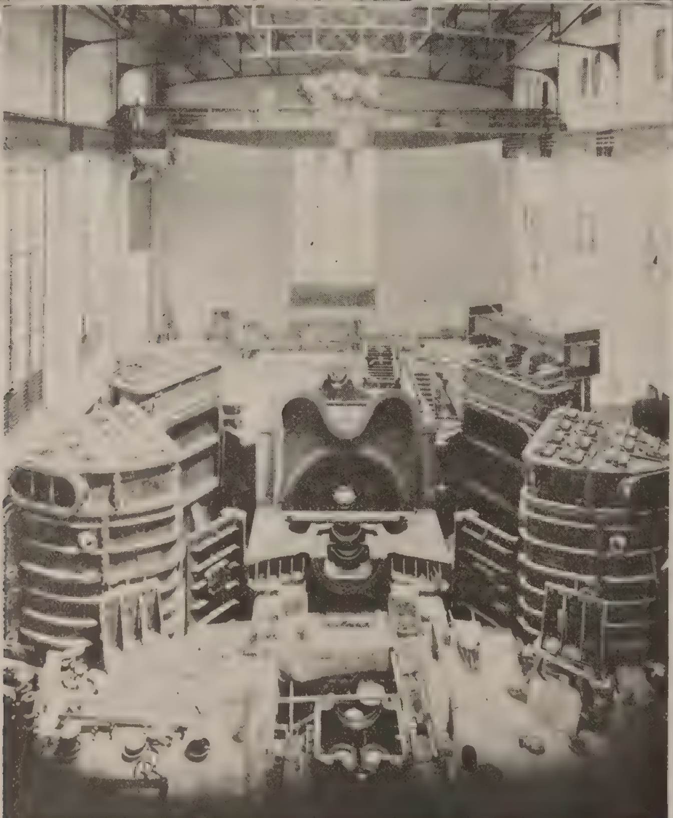
## *Heavy-Duty Appliances Beckon*

FOR its sales objective the power industry has the electrification of the civilized world. As a potential load builder the modern home challenges the best efforts of the manufacturer, the dealer and the energy vender, defining load in broad terms. The ultimate consumer is interested in convenience, in saving himself or herself work, and in devices which contribute to the pride of life, to comfort and to service of high quality. James H. McGraw touched a responsive chord in his Atlantic City address when he referred to the luxury appeal of many nationally advertised commodities. The American viewpoint is focused on better living rather than upon parsimonious existence, and the development of the market for electric service in the homes of the United States should never fail to capitalize this distinction.

Heavy-duty household devices, typified by ranges, refrigerators and water heaters, are moving into the center of the commercial stage. Amazing success has been attained in selling many devices in a market of striking diversity as to buying power. Utility executives brought up as engineers are rapidly realizing the sales problems of the industry and turning their powers of analysis and constructive thinking to commercial expansion. Idle investment in plant and lines is being attacked and overcome by discriminating load building. Without neglecting devices ministering to convenience and enjoyment of life at the cost of low energy consumption, sales departments are concentrating upon the real load builders this year as never before. We shall see the results as the index of per capita energy consumption rises and as the pitifully small kilowatt-hour usage per residence customer so many companies still manifest grows toward adequate development. The heavy-duty appliance is the key to economic utilization of the investment required to serve electrically the far-flung homes of this favored land.

It is true that competition for the consumer's dollar is acute, but if the want is created by suitable advertising and other sales effort, our industry need not fear of getting its share of popular expenditures for better living. Business in volume is affected materially by prices, but ease of buying seems to be the key to growth of sales in the residential field, when coupled with the right appeal. It is significant that progressive power companies are widely establishing prices representing complete installation coverage and that they are getting away from the step-by-step method as fast as possible. "So much total" for an installed range or water heater, rather than "so much for the equipment" and "so much more for wiring and plumbing," if needed, is the line of least resistance. The deferred payment plan is a time-honored method and needs no defense. Rates are fast settling into a sphere of usefulness which enables the advent of heavy-duty devices at reasonable operating cost; the products of American electrical manufacturers of rank are unexcelled in beauty, durability and convenience, and the stage is set for profitable performance and satisfaction on the part of all who are prepared to play their parts according to sound business principles.

# Long Beach Steam Plant Nears Completion



WORK on the Southern California Edison Company's Long Beach steam plant No. 3, which will have an ultimate capacity of 720,000 kw., is progressing rapidly and the first unit will go on the line shortly. The first of eight 90,-000-kw. units is noteworthy because of its size and the terminal voltage of 16,500. The turbine is a single-shaft, tandem-compound unit which will utilize steam at 400 lb. gage and a temperature of 725 deg. F. The condenser circulating water discharges into a 22-ft. tunnel. The furnaces are constructed so that pulverized coal may be used in the future if desirable.

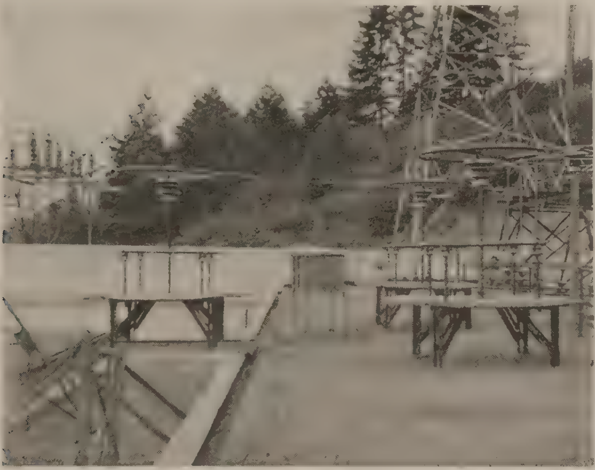
## *Surge Tests on*

# Isolated Neutral Network

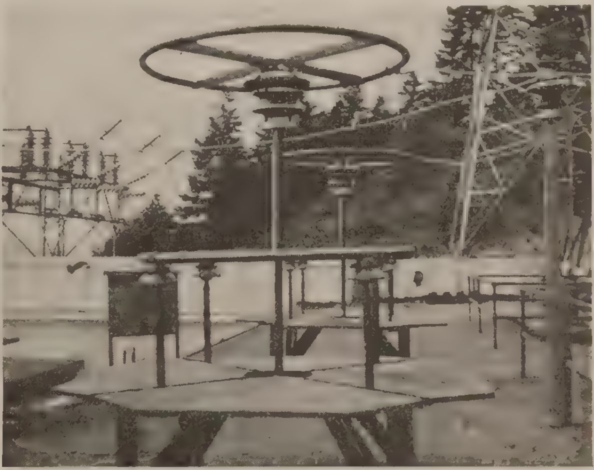
Klydonographs showed 26 per cent of surges on 55-kv. system to be above three times normal voltage

### By R. Rader and V. B. Wilfley*

During the summer of 1927 tests were made on the 55-kv. isolated neutral system of the Puget Sound Power & Light Company to determine more accurately the causes of insulation breakdown, flashovers and kindred troubles resulting from switching operations, grounds, short circuits and other causes of transients. The 55-kv. system of the company consists of a network of 356 miles of line and is one of the few larger systems still operating with neutral isolated. As a consequence, the problem of minimizing troubles from faults occurring on the system is one of major importance.



*Complete three-phase potentiometer installation*



*Assembled potentiometer for klydonograph test*

Three klydonographs placed at salient points on the system were used in making the tests. The klydonograph as an instrument for recording high-voltage surges has been described a number of times since its development by J. F. Peters in 1924 and will be discussed only briefly here. The mechanism is contained in a compact case which includes a photographic film revolved slowly by clockwork to produce a continuous record. One 8-ft. film will last a week, or, if operated non-automatically, the time and spacing of the pictures can be governed at will. The proper normal voltage of 2,500 to 3,000 volts, crest value, across the instrument is obtained by means of potentiometers between line wires and ground. Fig. 1 shows a simple diagram of the electrical circuit.

The potentiometers were constructed by the Puget Sound Power & Light Company, the plan of a single unit being shown in Fig. 2. Three such units are necessary for each three-phase klydonograph. It may be noted that the two rings consist of 1½-in. iron pipe bent into circular form with ends welded. The upper ring was mounted on a 73-kv. insulator and the lower ring on four 13-kv. insulators. The four sections of the ground plate when clamped together formed an octagonal shaped plate which was mounted on wooden supports and connected solidly to ground. The four rods supporting the 13-kv. insulators and the lower ring were clamped between sections of the ground plate, making it possible to regulate the elevation of the lower ring. Each unit was adjusted separately, since the sphere gap calibration took care of any variation. The rings were approximately 4 ft. 6 in. in diameter, which is recommended for voltages of the class under test, although reasonable variations are permissible where space is a limiting factor. A small wooden housing with glass window was used for protecting the klydonograph from the weather. The potentiometers were placed in the form of an equilateral triangle, as shown in one of the accompanying illustrations, with approximately 9 ft. between adjacent live parts. In the center of this triangle was placed the klydonograph in its wooden housing.

---

*Office engineer Puget Sound Power & Light Company and engineering division, Westinghouse Electric & Manufacturing Company, respectively, Seattle, Wash.

The recording operation of the klydonograph is comparatively simple. A surge of any magnitude on the transmission line will appear in the same magnitude on the upper ring and for any fixed position the potential on the lower ring will always be proportional to the potential on the upper ring, hence the line. The klydonograph, being connected between the lower ring and ground, receives a certain proportion of this potential, the ratio or multiplying factor being determined for each set-up by

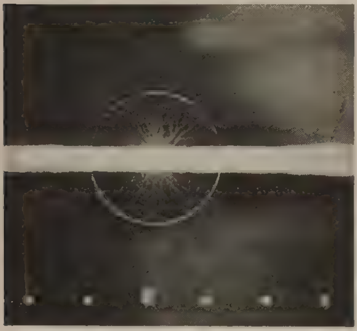
calibration. Normal line voltage was obtained by means of the station potential transformers and instruments. Voltage between the lower ring and ground was obtained under normal voltage conditions with ⅜-in. spheres adjusted so an arc would just break over. The voltage corresponding to this separation was read from the sphere gap calibration curve illustrated.

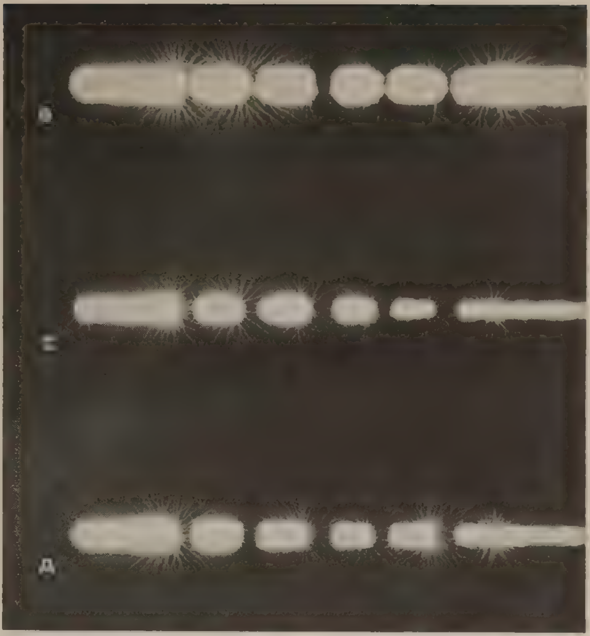
Knowing the ratio of line voltage to that on the lower ring, it was next necessary to determine the actual voltage on the lower ring produced by a surge as recorded on the instrument. This involves a knowledge of the relationship of the picture appearing on the film and the voltage producing it. The calibration curves illustrated showing this relationship had been made previously by the manufacturer as a result of extensive experimental work. In these curves crest voltage on the lower ring is plotted against the radius of the figure on the film.

As an example of the calibration of one of the potentiometer units, it was found that after the height of the lower ring had been adjusted the sphere gap arced over at 0.020 in. separation as measured with a thickness gage, corresponding to a crest voltage of 2,930 on the sphere gap calibration curve. The line voltage read 55,000 volts between wires or a line to neutral potential of 32,100 r.m.s. volts. Assuming a sine wave, the crest value was therefore 45,400 volts, which, divided by 2,930, gave 15.4 as the calibration factor for this potentiometer. For this calibration the upper ring was about 5 ft. above the ground plate and the lower ring about 2 ft. above the ground plate. The two other units were calibrated in like manner.



*Surge record marked for measurement*

Klydonograph studies were begun at White River, the largest and most central generating station on the system with a capacity of 60,000 kw., three three-phase instruments being located there for several weeks. The location of the instruments and related lines and bus sections is shown in an accompanying diagram. Later the instruments were moved to the Massachusetts substation in Seattle and to the Beverly Park substation, some 30 miles north of Seattle. Three instruments were found desirable on this extensive system to expedite tests and allow analysis of surges from simultaneous records taken at different points.

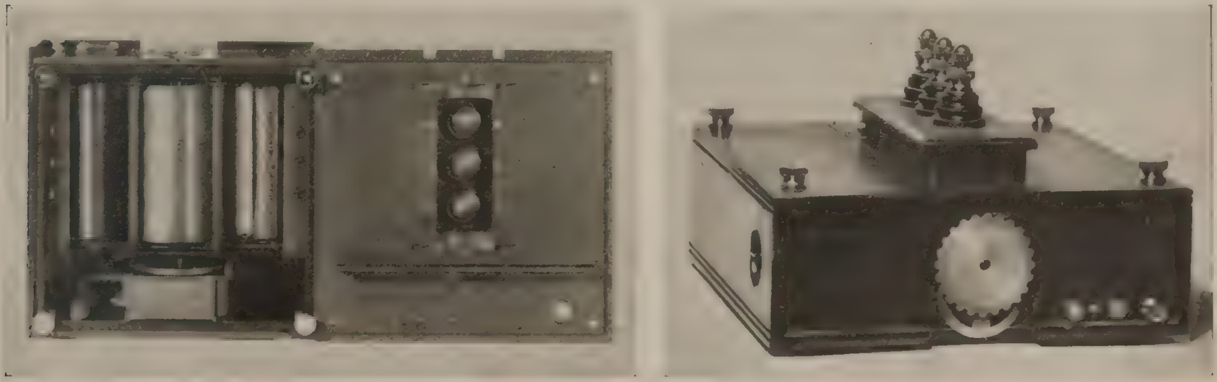


*Section of developed klydonograph film*

The discontinuous line indicated is the daylight line produced by admitting light through a small hole in the instrument case. It serves as a check on time, also recorded by the dots shown. Beginning at the left of the film the lines representing the phases are caused by the normal voltage and are continuous until a circuit breaker operation removes the potential from the instrument. Widths of the lines vary due to differences in calibration of the instruments on the three phases. It is characteristic of the instrument for slight changes in voltage in the lower part of the operating range to produce considerable change in width of the normal voltage line.

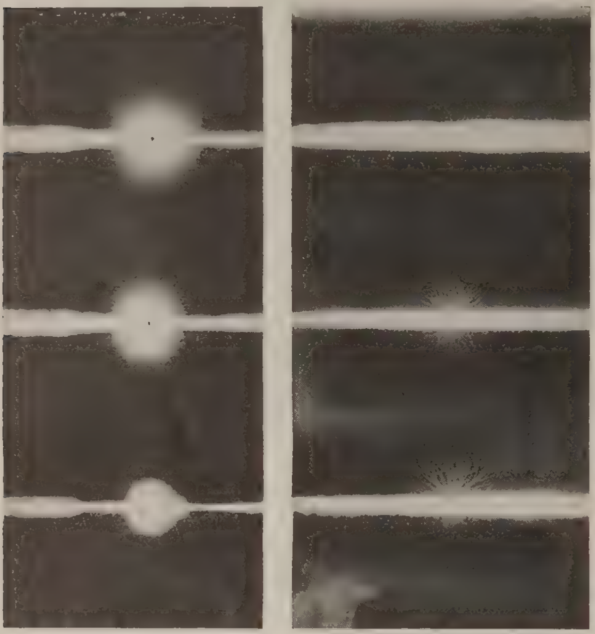
Oil circuit breaker switching tests, totaling 144 operations at various points on the system, disclosed that practically every operation produced surges on one or more phases, ranging in voltage value from normal to 3.9 times normal. A classification of surge values follows:

| Magnitude of Surge | Per Cent Total Number of Operations |
|---|---|
| Three to four times normal | 8.3 |
| Two to three times normal | 26.6 |
| One to two times normal | 65.1 |



*Standard three-element klydonograph*

High surges were obtained on both opening and closing of circuit breakers, those obtained on opening being somewhat more frequent. Lines under test were equipped with lightning arresters, but no discharges due to surges were observed. However, few of the surges were above the operating voltage of the lightning arresters and in general the higher the voltage of a switching surge, the briefer its duration, so that probably the higher surges recorded had a total duration of less than enough to warrant the operation of the type of arrester on the system.



*Figs. 3 and 4—Typical examples of klydonograph pictures produced by short circuits, arcing grounds and transformer bushing failures*

The size of the images in Fig. 3 is due to repeated surges from arcing and from switching operations. The surge on one phase reached 4.9 times normal voltage, or 220,000 volts to ground.

After completing the switching tests the instruments were installed at three salient points on the system and left in continuous operation to record the effects of faults which might develop. Twenty-two records were thus obtained, including trouble from short circuits, arcing grounds and transformer bushing failures. Figs. 3 and 4 represent typical examples. The intensity of Fig. 3 is due to repeated surges from arcing and from switching operations. The maximum surge occurred on the upper phase and reached 4.9 times normal, or 220,000 volts to ground.

Surges from line troubles proved to be greater than those caused by switching, 26 per cent being above three times normal. Operating experience shows that arcing grounds give the most trouble, and although each surge is of short duration, continued arcing very frequently causes insulation breakdown at several points on the system before the line can be cleared.

The tests proved conclusively the existence of high-voltage surges on the system during times of line trouble and during switching, either with or without the interruption of load current. The measurements were sufficiently accurate for practical use and have given the operating engineers a clearer vision of what actually occurs under the conditions described. The information has proved useful in planning ways and means of preventing equipment failures and service interruptions. Results are in line with other limited experiments on the magnitude of surges to be expected on ungrounded systems and accentuate the advisability of using star-connected transformers with grounded neutral for high-voltage transmission. This seems especially true in connection with the rapid strides being made in the development of protective equipment, whereby all classes of system trouble may be quickly isolated and localized.

## Cost of Fuel-Handling Equipment

EXCLUDING overheads, the following data give the installed costs of miscellaneous fuel-handling equipment estimated on a 1927 basis by the engineers of a New England light and power company. To all items 5 per cent may be added for contractor's compensation, but no allowance for engineering, interest during construction, taxes during construction, etc., is included.

*Miscellaneous Fuel-Handling Equipment Net Cost Data (1927)*

(Installed, Without Overheads)

| | |
|---|---|
| Coal unloading tower structure, hopper and service equipment, 22 ft. x 25 ft. x 167 ft. high, with four reinforced concrete piers on 40-in. thick reinforced concrete mat on hard pine grillage supported on wooden piles; superstructure structural steel tower with outrigger arm for bucket hoist trolley; receiving hopper, ½ in. thick plate; lighting equipment and heating equipment (65 sq.ft. exhaust steam radiation) included .................... | $62,607 |
| Raw coal bunker in boiler house, reinforced concrete on steel beams and girders, hopper-shaped bottom, bunker 40 ft. wide, 224 ft. 6 in. long, 24 ft. deep, maximum capacity 20 tons per linear foot ...................... | 67,635 |
| Three fuel oil riveted steel storage tanks, each 95 ft. diameter, 30 ft. high, with extended bottoms 105 ft. diameter, 12 ft. 6 in. high for fire wells; foundations 8-in. thick cinder concrete mat with 1-in. plastic cement top; tanks equipped with wrought-iron ladders, fire protection plank float over entire oil surface, steam line supply and lightning protection of galvanized wire network on poles over tanks with ground connection...... | 136,862 |
| Fuel oil service tank, foundation and fire protection, riveted steel, 42 ft. diameter, 20 ft. high with extended bottom 52 ft. diameter and 5 ft. high, foundations similar to above ...................................... | 8,794 |
| Fuel oil sludge tank and house, riveted steel 7 ft. diameter, 34 ft. 6 in. long, supported on concrete cradles, corrugated-iron sides and roof ...................... | 1,309 |
| Pulverized coal bunkers, four in number, 80 tons capacity each, structural steel frame supported on building steel, shell of bunkers 5/16 in. thick steel plate with exterior covered with 1½ in. thick layer of asbestocel with ½-in. layer plastic cement; inside of bunker has air pipe for circulation ........................................ | $47,109 |
| Coal pulverizing house building, 40 ft. x 85 ft. x 22 ft. high, with upper portion 40 ft. x 69 ft. 3 in. x 60 in. high; foundations reinforced concrete mat without piles, superstructure steel, brick and reinforced concrete, tar and gravel roof, 1925 cost ......................... | 167,676 |
| Lighting installation of above with 100-watt lamps, etc., including conduit, vapor-proof fittings, etc., 1925 cost.. | 1,498 |
| Heating installation for above...................... | 3,430 |
| Plumbing for above ................................ | 842 |
| Unloading tower, Hunt 1½-ton bucket, King 15-in.x15-in. hoisting engine, 160 lb. pressure, two cylinders; also 10-in.x12-in. two-cylinder hoisting engine, with hoisting ropes, track, etc. ...................................... | 13,176 |
| One single roll 24-in.x40-in. crusher, Pennsylvania armor type, driven by 50-hp., 550-volt, three-phase Westinghouse motor ........................................ | 4,201 |
| Two 300-ton per hour, 36-in. belt conveyors, 30 ft. center to center, 15-hp. motor ............................ | 12,334 |
| One 134-bucket conveyor, 15-hp. motor, buckets 24 in. x 18 in. x 11 in. ........................................ | 14,414 |
| One weightometer for 36-in. belt conveyor............. | 2,905 |
| One 2-ton coal railway, automatic, with two platform scales and 230 ft. of 19-in. gage track and car (wooden) | 2,613 |
| Two fuel oil rotary pumps, 753 gal. per minute each, 50 lb. working pressure and motor drive ................ | 10,030 |

# The Trouble with Buying

### The basic causes of price cutting. Where the seller and the buyer are responsible. Three things to do about it and two recommendations for a course of action

By Earl Whitehorne

*Commercial Editor* Electrical World

EXECUTIVES of American industry realize today that they have made a serious mistake through the last quarter century. They have allowed themselves to become so absorbed in the problems, the achievements and the fascinations of production that they have neglected distribution. Our methods of distributing our goods have grown by main strength and awkwardness. And so the American business man faces this well-known problem. It is constantly discussed, and if all the paper that has been used up in writing about distribution were placed in one pile it would probably interfere with the orderly progress of some star. Also, something else has been happening that has not been generally noticed. This tremendous increase in production has brought with it an intense pressure on sales. The growing output of the factory—everybody's output—has been driving the salesman to desperate ingenuity. And American industry has also become so engrossed in selling that it has neglected the efficiencies of purchasing. The world has honored and courted the salesman, while the purchasing agent has gone his way unseen and unsung. And yet for every sale there must be a purchase and the practices and the policies and the principles of the man who buys have as much influence upon the success of the transaction as the methods and the motives of the man who sells.

*This article, which concludes a series of discussions by Mr. Whitehorne on the very pertinent problem of price cutting, was presented before the recent annual convention of the National Association of Purchasing Agents in Kansas City.*

*His first article, entitled "Who Pays the Cost of Price Cutting?" was published on Feb. 18 and was followed March 17 and May 19 by an analysis of experiences and opinions of both buyers and sellers. And these, in turn, have called other writers to expression.*

*The subject is of universal interest because every business organization must both buy and sell and pay a price. Certain recommendations are made in this article and the editors will welcome frank opinion.*

The time has come, therefore, to turn some thought upon this business of buying that has so much to do with whether sales are profitable or not. We have got to throw the searchlight on the present status of the purchasing function in industry just as we have got to study and reform the process of distribution in this country.

### By Guess and By God

For we have reduced our manufacturing to a science. We think in terms of B.t.u.'s per ton of coal. We invest thousands of dollars in machines that will make possible the continuous saving of a fraction of a cent. We select and organize our labor and support each operation with four-and-a-half horsepower. We govern the very motion of a man's hand. Yet we do our purchasing too often "by guess and by God," we sell at whatever price will get the order and we deliver the goods by an overgrown mechanism of distribution so cumbersome that it often costs more to get the shipment into the hands of the customers than it costs to manufacture it. In other words, while we pour science and efficiency into our production we proceed with the selling and the buying of these commodities that we have so zealously and skillfully produced by a system so hit or miss that as soon as we get into a buyers' market the sellers start cutting prices and the purchasers begin to profiteer, and there is a general warfare between the very men who must depend upon each other for the conduct and prosperity of business. And economic warfare is no less destructive of dollars than the battling of armies. And so today we have many branches of industry very much exercised over the prevalence of price cutting, with nobody knowing just what to do.

Well, what should be done? One thing is certain, there is no general cure-all for price cutting—no panacea that will save the world. The only sensible approach that I can see is to examine into the causes and see if any common sense corrections can be found. Obviously, there are two causes—what the seller does and what the buyer does.

Well, what do they do that causes price cutting and demoralizes markets? Let's take the seller first.

The seller in a buyers' market becomes afflicted with overproduction. This brings on an acute attack of "volume-itis" and pressure is put on his salesmen to get orders. At the buyer's doorstep his salesmen meet other salesmen who are suffering from the same anxiety. Some of them are armed with the weapon of cut price. To get orders, to get volume for the factory, they have been told to sacrifice the profit. They do. And when one does, many do. And this induces a kind of hysteria, a state of mind that is just a form of fear. It is price cowardice. It is a kind of mob psychology that will sweep right through the salesmen of any branch of any industry.

There is only one thing that cures this kind of demoralization. If the salesman's boss possesses the intestinal fortitude to control him and to lead him out of his fear it can be stopped. Otherwise it runs its course till it ceases from exhaustion.

### Price Courage

It is a simple thing—price courage. When a manufacturing company enters the market with a line its officials set a schedule of prices based on their costs, which in turn are regulated by competitive conditions. If the president of that company will permit his sales manager to come in and talk him into permitting a price cut to get some big order and the salesmen find it out, then the salesmen will everlastingly be importuning the sales manager to let them cut to meet another bidder on this job and that. But when the sales manager knows that the president has price courage, that gives him the guts to stand up against the salesman. And when this salesman knows that the sales manager also has price courage he will battle with the buyer and refuse to telephone the office and ask for a better price. To put it flatly, the salesman who believes in his boss carries price courage wherever he calls. Price cutting is not the salesman's fault. It is the fault of the executive who cannot face the fact that the only relief in a market demoralized by overproduction and price cutting is reduced production. It is the fault of the executive who lacks the pluck to reduce his output rather than sell at a loss. Industrial America at present is volume mad. But manufacturers ultimately will have to face the economic law that to sell at a loss is waste and an offense against industry. And when prices fall below cost they will have to accept their individual responsibility voluntarily to curtail production as their contribution toward restoring the market to a balance.

## *What to Do*

*1. If the purchaser would demand firm bids, then general price cutting would soon cease. For a firm bid is like a signed order. It's the word of the house. It puts industry on the one-price basis just as solidly as the modern department store. It means that a price made is the best and final price and the buyer is expected to place the business by selecting the firm bid that offers the best value—not price alone but value.*

*2. While this practice of firm bids is crystallizing into a custom, whenever bidders are called back by a purchasing agent and asked for a better price, let the bidder demand that the other bids be shown to him, so that he will know that he is not being lied to, and that his price is indeed high for equal value.*

*3. And while the trickery of baiting bidders still continues in the world of business let bidders hold post-mortem comparisons of bids, by submitting their bids on closed business to their trade associations for comparison and report.*

*4. And let the buyer frankly and publicly proclaim that he will thereafter shun the man who cuts his price, because the first price is supposed to represent the honest value of the goods, and the man who cuts stands self-convicted either of trickery or weakness.*

This sounds very idealistic. I realize that. But price cutting today is due more to the folly of the seller than to the cupidity of the buyer, and the seller will have to provide his share of the reform. And, of course, he can, for he always has the power to refuse to sell. He can control the price at which he himself sells, if he is willing when necessary to sacrifice volume for profit.

### The Buyer's Weakness

Now let's take a look at the buyer.

The purchasing agent has always been the redheaded stepchild of industry. In the beginning the boss did the buying in odd times. Then he detailed a young man to help him. As buying has grown in volume purchasing agents have become more important, until today in many progressive corporations the buying is done by a vice-president with an able staff, and he is a big man with a broad knowledge of markets and men. But in too many cases the purchasing agent still lacks the responsibility and authority he needs to make his job measure up to his titular function. Too often he is just expected to buy what he is told and his performance is measured by his ability to save money on price.

He is more or less in the unenviable position that the policeman occupied say twenty years ago. The policeman's job as he saw it then was to walk his beat and swing his club and hope that he could catch some son-of-a doing something. And the whole world hated the cop. And then came the automobile and traffic, and we took the cop and set him on the crosswalk to help the people and to keep the cars moving. Now the world is for him. He is our friend. Just so there are too many purchasing agents today working with a mental attitude that is protective, detective and combative. They are working with the defensive idea of getting what they must buy for the lowest price instead of the constructive, productive idea of developing the greatest possible value for the dollar spent. Financially it may be the same. But phsychologically and economically it is very different. One is positive and the other is negative. One stimulates and the other depresses. One promotes co-operation and good service and the other doesn't. In the last few months I have discussed this business of buying with a good many men—purchasing agents and sales executives both. I have discovered one very interesting thing. Man after man has told me with pride and enthusiasm of the ideal relations which they have established with some buyer or some seller.

With this customer or this vender they have understanding and reciprocity. They know each other. The seller appreciates just what this buyer needs in quality and in service. He knows the organization and how it works. He and the purchasing agent pull together like a team of good gray horses. They keep each other advised as to the trends of the market. When the factory is running slack they anticipate requirements a bit. They discuss costs and profits at times and protect each other. The buyer knows that in an emergency that seller's factory will turn itself inside out to serve him.

There is no price cutting between this pair. They are dealing in values.

I know one purchasing agent who tries each year to call at least once upon the presidents of the principal companies from which he buys. He wants to get acquainted, to see the factories and judge whether or not they are efficient, to size up the organizations, the plants and the principles that stand behind the goods.

### Sales Executive Calls on Buyers

I know of one very large industrial buyer—one of the greatest in the country—who not so long ago sent a vice-president, no less, traveling the country calling on the presidents and sales managers of the manufacturing companies from which he buys, just to inquire whether they were entirely satisfied with the treatment they were receiving from his people. I daresay he carried smelling salts to administer to those who were overcome by the shock. And when this vice-president returned home and had recovered from the entertainment he said that he believed this trip to have been one of the best investments his company had made, reckoned in terms of good will and insurance of the material and service being supplied.

There are many enlightened buyers who are doing this kind of thing. They do it because it helps them in their business. It costs money in the long run to scatter business in small purchases, now from one and now from another. It costs money to haggle with salesmen. It costs money to bicker over bids. It costs money to break in new venders, to establish specifications and assume quality.

As one large buyer stated it to me, "There are four factors in every purchase that should be given consideration in the order named:

"1. Suitability to the need.
"2. Quality of the article.
"3. Responsibility of the vender.
"4. Price.

"Price is only one of the elements that must be weighed in establishing a value, and it should not be considered until the three other factors have been established as satisfactory." That is a pretty broad statement, but I believe it is a true one. This man knows what he is talking about.

Therefore, if the purchasing agent is to contribute his share toward overcoming this practice of price cutting that industry is suffering from and stewing about right now he must face these facts, and, facing them, he will bring new dignity to his profession and new opportunity to himself. He must recognize that nothing short of this ideal relationship between the seller and the buyer is really efficient and profitable. He must set his entire operation as nearly as possible on that plane and make value, not price, the chief objective. He must study the cost of buying as well as the cost of goods.

For who knows today which costs the most—to shop among fifty venders or to establish a close co-operative relationship with twelve? How much more does it cost to interview fifty salesmen than to give the same time to representatives of six selected suppliers who qualify completely in all the other factors of value?

Oh, I know the arguments! There are good ones a-plenty on both sides. But the point I make is that we have too little accurate knowledge of what it costs to buy, too little recognition of the relative importance of value as compared with the mere price factor, too little measuring of price against the other factors. And, in a word, industry will have to learn more about the economics of buying and organize its purchasing on a more constructive basis for the production of better values in trade before we put an end to the ruthless waste of price cutting.

How do we start? That is the pertinent question. There is a simple way, I believe. There are four things to be done. I have mentioned them on other occasions, but they need much repeating. I have listed them, therefore, in the box on page 1286.

Price cutting is just an economic disease. It can be cured. It can be cured by public opinion within industry. And immediate relief can only be sought through the building of public opinion among buyers and sellers. But the only way there is to develop public opinion is by discussion that corrects loose thinking and makes clear the moral and economic principles which all men desire to follow once they are generally understood.

## *Suggestions for Immediate Results*

*1. That the trade, industrial and business publications of the country promote the widest possible discussion of the economic inequity of price cutting, drawing out the opinions, principles and practices of the leading men of the field and developing a more common acceptance of the truth of it and a more general adoption of these simple resources of correction.*

*2. That the trade and industrial associations of each branch of industry support this purpose by calling a conference of the leading purchasing agents of the group to meet with a representative number of their prominent sales executives, for a discussion of the ethics and economics of this business of buying to the end that trade practice in that field may be improved both in selling and in purchasing in so far as price cutting is concerned.*

This calls for leadership, and I believe that in this kind of a situation this leadership can best come from two sources—the industrial associations and the industrial press. I, therefore, offer these two suggestions, which I believe will bring more immediate influence to the correction of the practice of price cutting than any other action which might now be attempted:

1. That the trade, industrial and business publications of the country promote the widest possible discussion of the economic inequity of price cutting, drawing out the opinions, principles and practices of the leading men of the field and developing a more common acceptance of the truth of it and a more general adoption of these simple resources of correction.

2. That the trade and industrial associations of each branch of industry support this purpose by calling a conference of the leading purchasing agents of the group to meet with a representative number of their prominent sales executives, for a discussion of the ethics and economics of this business of buying to the end that trade practice in that field may be improved both in selling and in purchasing in so far as price cutting is concerned.

I have asked a good many sales executives this question, when they have been discussing this buyer market:

"What is your own purchasing agent doing? Is he buying in the way that you would like to have your own customers buy? Does he foster price cutting?"

To many of them it has been a new slant on the subject. And yet there is no single influence more important to success in sales than the methods and principles of the man who buys. It is worth while, therefore, for the sales-minded chief executives of industry to see that their own purchasing methods are right.

The industrial press can help promote such a check-up. And a systematic discussion of the business of buying by such groups of purchasing agents, with executives present, would have a far-reaching effect in automatically applying common sense and curing this malady.

## Three-Power Locomotive for Switching Service

By S. T. Dodd

*Railway Engineering Department, General Electric Company*

A THREE-POWER electric locomotive has recently been placed in service by the New York Central Railroad. It is, primarily, an electric switching locomotive operating from either a 600-volt trolley or third-rail supply. In addition to this, when used in yards or sidings where no electrification has been installed, storage batteries enable operation for considerable periods.

In order to charge the battery an oil engine-driven generator set, having sufficient capacity to operate the locomotive at slow speeds without the battery, is provided. In normal service the load factor of a switching locomotive is about 10 to 30 per cent and this design provides that the engine generator set will furnish the average power required, while the battery will furnish the intermittent surges or fluctuations. Using the engine and battery together, the locomotive is able to operate continuously in "off-trolley" service.

Overloading of the generator by the engine is avoided by providing the former with a drooping characteristic. At light loads the maximum voltage of the generator will balance the voltage of the battery at the finishing rate on full charge. The motor equipment consists of four geared motors rated at 415 hp. apiece. The locomotive will develop tractive efforts as high as 60,000 lb. The control power is the same for either trolley or battery operation.

The current for the secondary operating circuits, such as control, lights, etc., is taken from the storage battery. The interesting feature of the control system is the transfer between battery and trolley as a source of power. A main transfer relay is provided to change from battery to trolley or third-rail power. If the "battery run" button is open the locomotive will operate as a straight electric locomotive and no transfer from trolley to battery will take place. If this button is closed and the locomotive passes a gap in the third rail, or for any other reason is deprived of external power, the motor connections are automatically changed from trolley to battery.

While operating this way on the battery, if the locomotive again makes connection with the trolley operation will continue on the battery until the controller is thrown to the "off" position.

## *Analysis of Twenty Utility Companies or Groups in New York, Pennsylvania, New Jersey, Maryland and Delaware Handling Over 100,000,000 Kw.-Hr. in 1927*

Showing percentage of generating capacity in hydro, margin of generating capacity above system peak, extent to which energy is purchased, per cent utilization of generating equipment, system losses (including transmission, conversion and distribution), per cent of output to different markets, kilowatt-hour per domestic customer and generating capacity. Based on reports received from companies and presented in the May 5 issue of the ELECTRICAL WORLD.

# Electric Enameling Used
## *in Packard Plant*

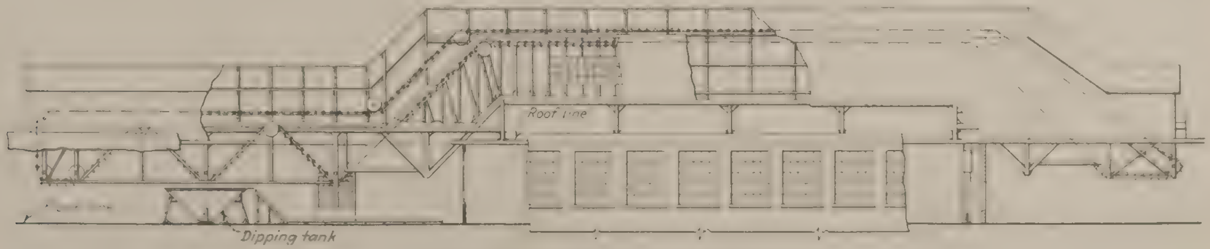
Ovens for continuous process effect large savings over batch method. Use of filtered air in counterflow to work assures quality of product and economy of heat

By R. J. Gaudy
*Executive Engineer Sessions Engineering Company, Chicago, Ill.*

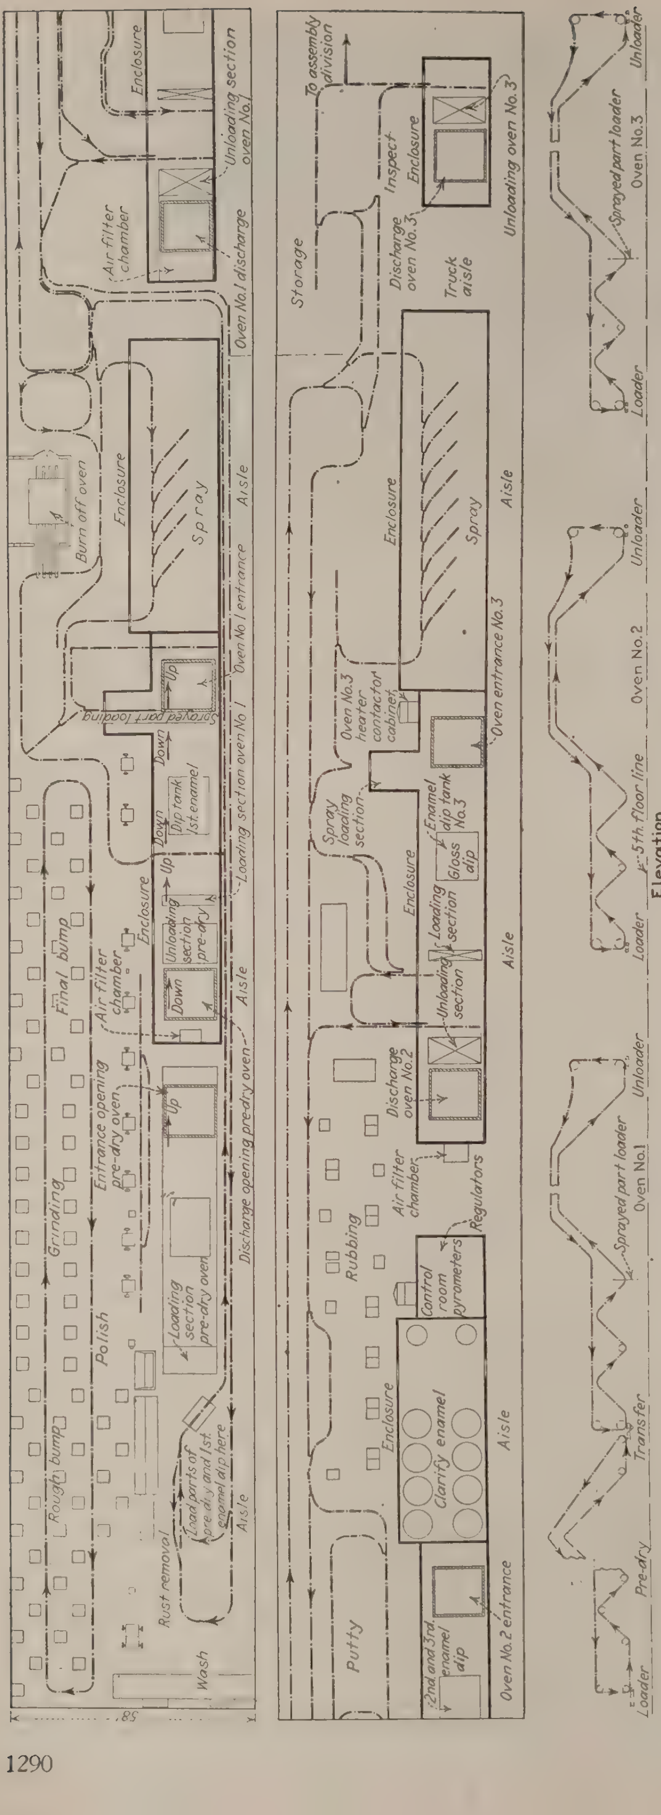
An added quality of enthusiasm may now be noted when you "ask the man who owns one" about the enamel job on the fenders and other parts of his Packard car. This is not to say that Packard enameled parts were ever less than the best job that could be done, but simply to state that Packard takes full advantage of advances in the enameling art as it does in all others. The latest forward step is the use of continuous process electric ovens which were designed and installed by the Sessions Engineering Company under the direction of R. R. Rees, manager of the construction division of the Packard company.

At its principal factory in Detroit the company has for a long time done all the enameling on the parts, so finished, in electrically heated ovens. A battery of 26 batch type ovens served for many years. These ovens were of the best pattern of the type, each oven being loaded by hand and carried automatically through a carefully determined time-temperature cycle. Such a production plant wherein batches of work are prepared, processed and released intermittently called for excessive, selective handling and spasmodic progress, which is conspicuously absent in all other manufacturing and assembling procedure in this plant.

The continuous operating enameling plant has distinct advantages which result from:



*Longitudinal section of oven construction*



General layout of enameling department shown by plan of work floor and profile of conveyor travel in ovens

1. A sequence of several continuous conveyor ovens, allowing the multiple coat work to be processed without interruption or storage, thus greatly reducing the chance of faulty product.

2. The manufacturing of parts ahead of finishing in a continuous stream of delivery. This continuity means that with conveyor ovens the flow is uninterrupted on through to the finish, and thence to the continuous assembly lines.

3. The inspection of work in progress being rigorously followed from the time the work enters the department, and the uniform flow of similar pieces to the inspectors permitting a well-timed inspection, which results in better selective criticism than possible with batch-by-batch inspection.

4. The power input and the attained temperatures and time of passing through the baking cycle being fixed over the length of each oven and all pieces by their uniformly rapid travel through the oven being, for each coat, subjected to exactly the same flow, baking and recooling cycle.

5. The dipping of work for each of several coats being done in single tanks of stock, continuously conditioned and perfectly controlled as to temperatures.

The greatest virtue of the continuous process in enameling is obvious. It is that, after their determination, the conditions which result in a perfect product may be maintained with great precision throughout the whole production flow. These conditions of heat, air properties, etc., must be re-established during each operation in the batch process and consequently they are more liable to error and change than if, once arrived at, they are maintained. It is much easier to hold oven conditions constant than it is to duplicate in following cycles the perfection of the first.

The oven layout, as evidenced from the drawing, shows the relative location of four ovens; these units are in the order of pre-dry oven, two-body coating ovens, Nos. 1 and 2, and finish coat ovens. The work after preparation, polishing and chemical cleaning is cleaned by torrent washing and immersion rinse, after which it dries rapidly and thoroughly in the pre-dry oven and is dipped immediately in the first coat of finish. The bond between metal and coat for which the Packard enameled parts are notable is assured by this unbroken series of preliminary steps. Thereafter, the parts are removed from the line of progress and inspected and prepared for each of a number of body coats. The two ovens, Nos. 1 and 2, are more densely loaded than is either the pre-dry or finish oven, as the work is passed through either No. 1 or No. 2 as many times as there are coats ahead of the gloss coat. After the body of the finish is built up as required and is rubbed this body is given the final gloss coat by a single passage through oven No. 3.

If the parts pass the final test for perfection a pendent conveyor system delivers the work as needed to the assembly lines. In addition to the constant speed conveyors through each oven, the complete mechanical handling system throughout the department is arranged so that the work is handled to and from each operator with the entire elimination of storing, trucking or rehandling. The work passing through the department comprises a wide variety of pieces that undergo an equally wide variety of treatments as to preparation and number of coatings. Certain pieces and assemblies are sprayed and introduced onto the oven conveyors between the dip tank and oven entrance.

As shown in the accompanying illustrations the work is handled to and from the ovens in sealed inclosures in which the supply of filtered (dust-free) air is applied under such pressures and in such quantities as to maintain the counterflow of air within the ovens. This counterflow opposes the flow of work and preheats the make-up air, unavoidably lost to the volatile removal, by cooling the discharging work. The thermal economy of such counterflow is pronounced.

The ovens are of the extended A type, rising over the roof of the building in which the department occupies the upper floor. The space below the oven runs is fully effective working area. The ovens consist of an internal structure fully dust-tight and carrying the conveyor runway. Around this interior is a continuous envelope of insulation.

The electric heaters are mounted on the floor and walls within the oven. The most perfect control and maintenance of temperatures is possible by the multiple circuit arrangement of heaters. The perfection of location and control and the predominance of radiant heat delivery, and, further, the lack of need for excessive movement of the gases within the oven far offset, for quality production, any possible differential inferred by the lower unit cost per heat unit of other classes of heat source.

As this oven cycle is designed to maintain a fixed curve of temperatures throughout the oven length, all circuits which are required to supply the constant losses are placed on manual switching and are held constantly on the line. The very small increment or decrement of input required by the heat carried out by the work is controlled by the oven temperature. Perfect performance as to load factor is limited only by the adjustment of the small variable input so that its "off" time may be minimized.

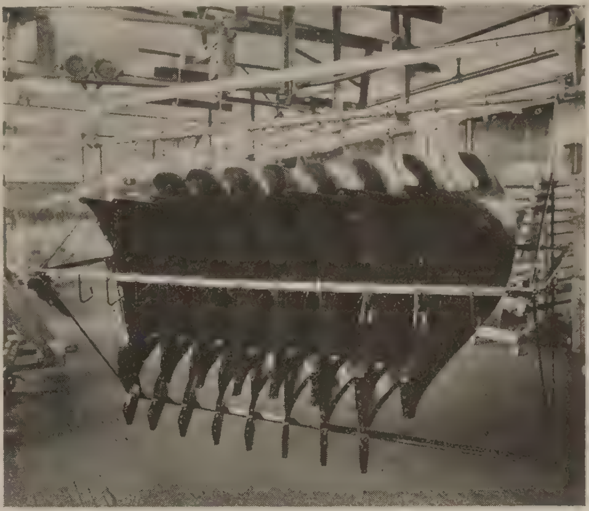
Cross-section of oven construction

There are two controlling recorders with elements located near both ends of each coating oven. The automatic control of the small amount of intermittent input may be assumed by either recorder. Both instruments are continuously recording, but only one is normally in control. If, due to variation in the heat drift caused by changing interception of counterflow, it is required to transfer the control to the opposite end, this is accomplished by a simple three-way flush switch.

The heaters are operated at the power service voltage for machine tool motors (460 volts, three phase, 60 cycle) from the company's standard power substations, which are supplied with primary energy by the Detroit Edison Company. The heater installation, as a non-inductive load with a power factor of unity, improves the over-all plant power factor. For example, if one-third of a load block were heater load, then the other two-thirds could operate at a power factor below 60 per cent, with a resultant for the total of 80 per cent.



*Work rack with fenders in process*

The improvement in electrical load factor of the enameling department is apparent from a comparison of the demand of the batch type ovens with the demand of the continuous oven that replaced them. The old ovens had a concurrent demand of more than 4,000 kw. A far greater amount of work is being done every day with the continuous oven, which has a connected load of less than 1,000 kw. The total energy consumed per set of parts for one finished car for all coats is less than 140 kw.-hr., as compared with more than 270 kw.-hr. with the batch type ovens. The conveyors, pumps, fans, polishers and all power tools are individually motor driven and operate at very high load and power factors.

The prime requisite of the Packard management for high quality of product has been thoroughly met by the performance of this finishing plant. The new equipment, with its wide variety of operations and the exact requirements in the control of the many variable conditions, is able to deliver product (1) in greater quantity; (2) at less cost; (3) with perfect uniformity; (4) of highest quality, and (5) with full freedom from troubles due to the recurring cycles in non-continuous plant.

The installation would have been fully justified by the improvement in the quality attained alone, but in addition the saving in power cost, handling labor, wasted enamel, rejects after baking and other direct benefits are of such value as to represent, at present production, a gross annual return of half of the total outlay.

# Multi-Speed Pump Control Maintains Water Level

By L. Stone
*General Electric Company, Schenectady, N. Y.*

PUMPS ARE used in the Waterside No. 1 station of the New York Edison Company to force water, in excess of the boiler requirements, from the surge tank to the mixing boxes of the feed-water heaters in Waterside No. 2. A special panel and control was found necessary adequately to regulate the operation of three centrifugal pumps functioning in parallel and which are driven by three 30-hp., 230-volt, variable-speed direct-current motors.

As originally installed, a special float switch was mounted over the discharge well and connected to a large float in a 12-in. pipe. This float switch had a number of contact points connected through throwover switches on the panel so arranged as to start one motor automatically when the level of the water rose to a predetermined point, and, as the water rose, to speed this motor up in three steps, and finally to cut in the second motor and speed this up in the same way as the level of the water in the well rose. It was found, however, that the characteristics of the pumps and the head against which the water was forced varied somewhat from the original analysis, and that the motors were continually accelerating and decelerating between points in order to hold the water level at the proper point and prevent loss through overflow. It seemed desirable to get a larger number of speed points, and the space available would not allow much increase in equipment.

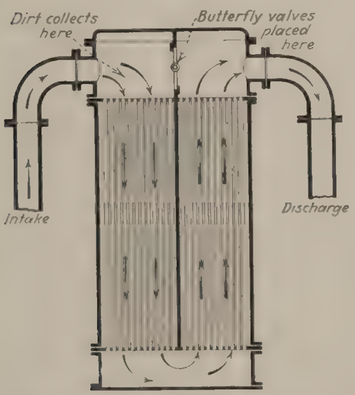
It was therefore decided to connect the armature of the motor first across 115 volts; that is, between one leg of the 230-volt Edison service and ground, accelerating with the three field resistance points, then to throw over to 230 volts and, again, by field acceleration, get the other increases in speed. This would give, instead of four points, eight points of speed regulation for each motor, or sixteen points in all. The additional equipment necessary was one neutral contactor, one auxiliary relay and a few changes in the interlocking and holding coils of the series accelerating contactors used in starting the motor. The float switch contacts were changed in the customer's shop, giving a final layout as shown in the accompanying figure.

The sequence of operations follows: The operator decides which pump he desires to run and throws the selector knife switches over to connect one motor in as No. 1, another as No. 2. The throw-over switches on the third motor are left open, although it is possible to close the third motor switch and use this in parallel with one of the others in case of an especially heavy demand. As the float rises, it closes the neutral line contactor and the motor accelerates by means of the series contactors to the low speed. Voltage and current coils of the series accelerating relays are all in circuit. If the water continues to rise the float switch moves on to segments 4, 5 and 6, which operate the three accelerating contactors, each cutting in a section of field resistance. When segment No. 7 is reached the contactor coil is energized on one side, but does not pick up until the moving arm runs off of segment No. 6. At this time the accelerating contactor is open, allowing the auxiliary contactor to close. The arm has, at the same time, run off of the segment holding the neutral contactor closed, which allows the line contactor to close and throw full voltage on the armature with all field resistance short-circuited. As the water continues to rise faster than the pump can pump it out the three accelerating contactors operate, which brings the pump up to maximum speed. The second pump starts and its speed increases in the same manner.

If the flow of water into the well decreases, the float lowers and cuts down the speed of the motor. The auxiliary contactor prevents reduction to low speed until the water level has fallen sufficiently to assure that there will be no hunting due to a small motion of the moving arm.

## Flushing Condenser Tube Sheets

THE Northeast station of the Kansas City Power & Light Company takes its condensing water from the Missouri River. This stream is not noted for its pellucid depths, but very much the reverse. At times it is necessary to keep a man continually at work removing débris from the trash bars and the revolving screens really revolve; they don't stand in one position for a day or so at a time, as is the case in more favorably located plants. In spite of trash racks and screens, however, there is an appreciable amount of more or less finely divided rubbish that must pass through the circulating water system. The condensers in the station are of the vertical double-pass design and it not infrequently happens that this rubbish will accumulate in such quantity on the surface of the tube sheet of the first pass as seriously to impede the flow of water through the condenser. The newer condensers in the station are arranged so that the water circulation in them may be reversed, and in this way the refuse collected on the tube sheet may be washed off. It was not possible, however, to reverse the flow in the older condensers and some means of cleaning the sheet, other than shutting the unit down and removing the dirt by hand, was highly desirable, and the means was found.



*Tube sheet flushing arrangement*

The accompanying illustration shows the general design of the condensers in question. Two butterfly valves, each one extending about half the length of the separating wall between the intake and discharge chambers, were installed. The only reason for two valves is that they are easier to handle than a single one. The valves are operated by levers attached to the valve shafts which are brought outside of the condenser shell. The first idea was that the valves could be thrown to the open (horizontal) position, indicated by the dotted line in the sketch, while the unit was in operation and that the water would rush across from the intake to the discharge side and wash the dirt off the tube sheet in its mad career. This result was not achieved, however, because the time required to open the valves permitted a gradual equalization of pressure between the intake and discharge sides and the water flowed smoothly across without the excited turbulence expected.

It looked as though the idea was impractical. Then it was suggested that the operating procedure be modified, the intake be reduced considerably, the valves then opened and the intake flow be released with a rush. It worked. The water dashed across the tube sheet and scoured the dirt off the tube sheet in a very gratifying manner. The whole operation takes only a minute or so. As a measure of precaution the load on the turbine unit is cut down while the flushing is going on, but it can be done, if necessary, with the turbine at full load. The only effect is a momentary loss of a few inches of vacuum, which are immediately regained when the butterfly valves are swung into the vertical position.

## Protection of Control Circuits

By John H. Nelzen

*Wisconsin Public Service Corporation, Crivitz, Wis.*

CONTROL circuits that are carried on pole leads with power lines are subject to occasional overvoltages caused by lightning, by crosses with the power lines and by induction from power line faults. These disturbances are dangerous to the control equipment and to operators. After a great deal of experience with different types of lightning arresters, none of which afforded perfectly satisfactory protection on 36 miles of control line, the Wisconsin Public Service Company tried out and found to be quite successful the scheme detailed here.

The control circuits are so devised that all operations are performed through the functioning of a single master relay connected across the control pair. The problem was to arrange some means by which this relay might be protected from extraordinary line conditions. A telephone insulating transformer of one to one ratio with the line winding parted and brought out in the center was installed. The relay was then placed between the two halves of the primary winding, which was connected across the control line. A condenser with a capacity of 6 mfd. was shunted across the relay terminals, as was also a gap-type lightning arrester. The secondary of the transformer is connected to the telephone and supervisory apparatus that also makes use of the control line.

# 24 Points on Range Selling

Analysis of potential market and sales methods made by C. J. Eaton,
commercial manager Middle West Utilities Company, for
the N.E.L.A. domestic electric range committee

AN EXCELLENT cross-section of electric range selling methods used by central-station companies in different sections of the country has been compiled by C. J. Eaton, commercial manager of the Middle West Utilities Company, in a report for the domestic electric range committee of the N.E.L.A. Commercial Section. With a view to studying these sales methods Mr. Eaton asked 24 pertinent questions bearing particularly on employees' use of electric ranges, campaign methods, quotas and advertising practices. From the replies received he was able to select those from 24 companies, which gave sufficiently complete data to tabulate and analyze. A study of the summarized replies to each question reveals a number of significant facts about development of the electric range market and raises some further questions to which both the central-station companies and electric range manufacturers should give thoughtful consideration.

The potential market for electric ranges as viewed by the various companies ranged between 50 per cent and 100 per cent of the customers in non-gas areas. On this basis, with 17,596,400 domestic customers connected to the lines of the power companies and approximately 10,500,000 artificial and natural gas ranges in use in the country, there remain 7,096,400 residential electric customers who should be using electric ranges. Only 590,000 electric ranges are in use, leaving a potential market of 6,500,000 in territories not served by gas. The question naturally arises in the minds of electrical men, why should not the other 10,500,000 domestic

## *Twenty-four Range-Selling Points*

*1. Basis of Making Quotas.*
It seems that most of the companies base their quotas upon the number of residential meters connected, taking into consideration the sales of past years, and general business conditions. One company points out that it does not deduct from the number of residences the number of ranges in use, for it finds that where there are a few ranges in use sales are more easily made.

*2. The Potential Market for Electric Ranges.*
The potential market is stated as being anywhere between 50 and 100 per cent of the lighting customers of non-gas areas. Some of the companies qualified their estimates by saying that a reasonable rate and a reasonable purchase price would be necessary.

*3. Methods of enlisting the support of the company employees in promoting electric range sales.*
Six of the 24 companies do not seem to encourage employee support in any way. Eighteen companies give bonuses for leads. Eight allow their employees to purchase ranges at reduced prices, usually at cost, and the same number of companies hold special meetings for the purpose of instructing employees in the desirable features of electric ranges, method of operation, etc. One company, besides selling ranges at cost to employees, gives them a half rate on energy used. The great majority of companies believe that employee support is very desirable, if not necessary, especially during campaigns.

*4. Basis of paying employees for turning leads in which result in range sales.*
Eighteen of the companies give bonuses ranging from $1 to $5. Some of them have time limits of 30 or 60 days. One company pays an extra bonus if a definite appointment for the salesman is made, and finds that this is most satisfactory. Another company requires that the employee talk personally with the prospect in order to be sure that the employee is actually boosting the company's sales and service.

*5. Merchandising relations with local dealers.*
Of the companies reporting, twelve have satisfactory relations with local dealers and twelve do not solicit dealer co-operation. The form of co-operation in most cases was allowing the dealers to tie in with the company during campaigns. Some of the companies carry the customer's account when sold by a dealer and allow the dealer a commission on sales. Several of the companies turn over the work of installation to the local dealers, which is very satisfactory to both parties.

*6. Plans for securing the support of domestic science schools.*
Fourteen companies have no special plans for securing the support of schools. Six companies give reduced prices, two of which also give special lectures and demonstrations. Four of the companies give special lectures to classes, but offer no inducement in the matter of price.

*7. Plans for working with the county home agents.*
Only five companies have any relations with county home agents and only one sells ranges to the agents at reduced prices. The other companies help in giving demonstrations and cooking schools in the county home agent's home.

*8. How the women's committee of the N.E.L.A. can be utilized.*
Few of the companies state how this committee can be utilized. There are some companies, however, that use the suggestions of the women's committee through their own women's organizations, giving lectures before women's clubs and societies.

*9. Developing electric range business outside of the gas district.*
With the exception of two companies, all of them leave gas areas very much alone, either because gas is used outside the company's territory or because of the fact that the company is also interested in the gas business and does not wish to compete with itself. In the case of the two companies, it was stated that they competed favorably with cheap gas and that they thought gas was a very small factor in retarding electric range sales.

*10. Basis of establishing the selling prices.*
Eleven of the companies sell at list prices suggested by the manufacturers. Twelve companies have their own method of establishing prices; three of them base it upon actual cost plus a mark up of 50 per cent. Two companies sell at list plus installation cost. One company establishes the price on basis of average overhead plus special advertising cost plus the salesman's commission and cost of installation. This gives a price equivalent to an 85 per cent mark-up on invoice cost. Six of the companies are careful to quote prices to their customers in lump sums, including the charge for installation.

*11. Methods of training the retail salesmen.*
The general method of training new salesmen is by means of the experienced salesmen and the manufacturers' representatives. Many of the companies hold frequent sales meetings for the proper instruction of salesmen, and manufacturers' representatives are usually asked to address these gatherings.

*12. Advantages of newspaper cooking schools and how they can be promoted.*
In regard to newspaper cooking schools, it seems that twelve of the companies have not tried the idea. One company has found the plan unsatisfactory, three have had only moderate success and eight companies believe them to be very valuable in stimulating sales. Most of the companies using the schools agree that they should be promoted by the manufacturer, keeping the utility company more or less in the background.

## *Twenty-four Range-Selling Points (Continued)*

*13. What advertising mediums can be effectively used, and the limitations of each media?*

The opinions of the companies in the matter of effectiveness of advertising mediums differ very much. Seven companies put their faith in direct-by-mail advertising and state that newspaper advertising is of the least use to them. Fourteen companies report that the newspaper suits their purposes best and two state that direct-by-mail is unproductive compared to its cost. One company uses recipe books to very good advantage in campaigns. Some of the companies operating in rural districts are of the opinion that displays at fairs and carnivals help their sales materially. Three companies had tried billboard advertising without expected results, one report stating that the effect of billboards could not be judged in any way.

*14. How can range business be developed in small towns, many of them without stores or daily newspapers?*

Eight of the companies believe that small towns can be developed only by solicitation. Some think that a demonstration in some rented place should be given before an attempt is made before solicitation. Two companies find that cooking schools run under the auspices of some local club, or sponsored by a grange or church society, are very effective in developing small towns. One company has a model kitchen built upon a truck body which it uses in giving demonstrations in smaller towns and they find that they get a great deal of publicity and noticeable results.

*15. Methods of compensation for retail range specialists.*

Three of the companies using range specialists pay them a straight salary, four pay on the basis of commission only and eight pay both salary and commission. Those companies using the latter system of payment find that they can get better men with that method and that there is a smaller turnover for salesmen.

*16. Time payments and down payments, and limits of each.*

Only one company of those reporting sells for cash and does not use the time payment plan. The down payment required by the others ranged from $1 to 25 per cent of the retail price. The time limit was from one to two years. The most general plan was 10 per cent down and a year to pay. Many of the companies emphasized the fact that the down payment should be large enough to insure the company of the customer's interest in keeping up with his proposed payments. Most companies charge from 5 to 12 per cent extra for purchase on the time payment plan.

*17. Advisability of utilizing general salesmen or employing specialty salesmen.*

Nine of the companies use general salesmen only, five use specialty salesmen exclusively and four use both. It seems that where the utility company is operating in cities specialty salesmen are used, and in a territory of small towns general salesmen are used. Companies operating in both cities of some size and smaller towns too use specialty salesmen in the cities and general salesmen in the territory covering small towns.

*18. Value of campaigns and form which they should take.*

Not many of the companies gave opinions as to how campaigns should be conducted, although all but one thought campaigns were valuable. This one company stated that the usual campaign stimulates sales, but a slump follows the campaign that destroys all effect of the stimulation. The commercial manager of this company uses contests between districts every three months that last for a period of two months each, and finds that system much more satisfactory. Another company, although it believes campaigns valuable in stimulating sales effort, does not offer special inducements to purchasers. It found that the prospective customer would always hold off buying until the campaign period. Many of the companies give premiums during the campaign period, or allow a smaller than usual down payment. None of the companies cut prices during campaigns.

*19. The seasonal characteristics of the range business and whether ranges can be sold throughout the entire year.*

The season characteristics of selling ranges seem to depend on the climate of the territory in which the utility operates. While all companies stated that ranges could be sold throughout the year, in most cases the spring and fall seasons seem to be the best for sales. In territories where the climate is moderate through the year the Christmas season seems to be the best.

*20. The farm market and how it can be developed.*

In the case of eleven companies the farm market has not been developed and they have no plans for the future development of that territory. It is the opinion of five companies that house-to-house solicitation is the only method of development. Four companies hold demonstrations at farm center meetings and gatherings of grange societies. Three companies carry on extensive work with state experimental farms and obtain much publicity and very good results from this activity. One company endeavors to interest rural districts by getting ranges used for church suppers. The company representative is present to see that the range is used properly and to answer questions. He allows the women of the church do all the cooking. A power company whose customers in rural districts nearly all use electric pumps sells the farmers transformers so that the customer can use power for household use at the power rate. This promotes range sales especially, the company finds.

*21. The effective forms of appeal to be used in advertising in the order of their relative importance.*

The most effective appeal used in advertising seems to be "convenience." Cleanliness, economy and dependability of operation are almost as important. Pride of ownership, modernity and safety are of only average importance. In the South the most effective appeal is the lack of heat radiating from the stove, which enables the housewife to cook in comfort during the hot part of the day.

*22. Store demonstrations—their value and how conducted.*

Eleven companies find store demonstrations valuable and three find them of no use. Four companies use store demonstrations once in a while, but their experience shows that a demonstration in a hall or theater is of much more value because of the fact that people are more apt to be open-minded and are more easily approached away from their store. Those companies that think the store demonstration valuable agree on the fact that it is best if food is actually cooked and served to those attending the demonstration. They also agree that the demonstration should be conducted by some one who is very well experienced in the operation of electric ranges.

*23. The value of demonstration in the home after the sale has been made.*

All of the companies agree to the value of a demonstration after the installation, some stating that it is the most important part of the sale. It is reported by some that it not only insures satisfaction to the customer but also enables the company's salesman to secure prospects from among the user's friends.

*24. Promotional work with architects.*

From the reports it would seem that not much has been done in promotional work with architects. A few companies, however, have understandings with local architects who draw plans for apartment houses. One company suggests that the best way to promote architects is to sell them electric ranges for their own use. The companies on the Pacific Coast believe that the Red Seal idea has materially helped their electric range sales.

---

customers at least be given a fair opportunity to use an electric range?

In the matter of selling electric ranges on rural lines eleven of the 24 companies apparently have not and do not contemplate the sale of electric ranges to their farm customers. It would seem that nearly half of the 24 companies are overlooking one of the best possibilities for giving the farmer the full advantage of electric service and at the same time boosting the energy consumption to a point profitable to the utility and advantageous to the customer. Furthermore, many companies are not taking full advantage of possible support from domestic science schools, the women's committee of the N.E.L.A. and the benefits of cooking schools.

A hopeful indication is seen in the attitude toward overworking the campaign method of selling. A number of companies have found that the reactionary slump following the stimulation of a campaign just about offsets any benefits derived and there is therefore a tendency toward continuous selling. Some advantage may be taken of seasonal characteristics, with special stress during the spring and fall.

# Taxes About 9.6 per Cent of Revenue

THE very considerable extent to which electric light and power companies have been utilized for the task of helping to collect national, state and local taxes is evident from a review of the operating revenue, operating expenses and taxes in those states for which the necessary data are obtainable from official sources.

The preparation of the accompanying table has been made possible primarily through the courtesy of public utility commissions, supplemented by data from published commission reports. An effort was made to cover every state in the Union in this survey, but owing to the lack of jurisdiction of commissions in some of the states the securing of complete data was impossible. However, the figures here presented account for about 64 per cent of the operating revenue of the industry during the year in question, 1926, and in view of the circumstances that municipally operated utilities are in most instances omitted the percentage of commercial companies is, in fact, somewhat greater. The omission of municipal systems, which usually pay either no taxes at all or a smaller percentage on their operations, makes the ratios deduced fairly representative of the situation for the commercial companies.

As might be expected, there is quite a wide variation between the states, but certain general conclusions may readily be drawn. Nearly 10 cents out of every dollar paid for electric service goes for taxes. For the states tabulated taxes consumed 9.6 per cent of the operating revenue. Assuming that the same ratio holds for the missing states, it follows that the industry paid, in 1926, about $160,000,000 in taxes. If the figures for Kansas are not added in, on the supposition that the inclusion of one-town companies in that state might affect the ratios, the total revenue for the remaining states becomes $1,026,163,248; operating expenses are $543,515,355; taxes, $99,303,840. The ratio of taxes to revenue then rises slightly, becoming 9.7 per cent.

Another striking feature is the relatively low revenue in proportion to valuation. Data on assessed valuation were not in all cases obtainable. In some a related figure, such as capital investment, could be secured. Here again the ratios vary among the states, but, taking all the figures in the valuation column together, regardless of the difference in basis, the average for the eleven states reporting on that item is $4.32 per dollar of revenue. The totals are: Valuation, $1,725,596,730; revenue, $399,780,862. The estimated total capitalization of the electric light and power industry in the United States corresponds to $5.40 per revenue dollar. The two ratios are in reasonable agreement, since assessed valuations are almost of necessity well below the actual cost of the property in question.

# Draining High Voltages *from Lines*

New device uses resistance column of electrolyte inclosed in composition tubes. Construction and operation

By CHARLES E. BENNETT
*General Engineer Georgia Power Company*

*Drainage devices installed on a 22-kv. line using disk gaps and pipe frame support*

THE question of lightning protection is one of great interest at the present time and much of a very technical nature has been written recently on this subject. There are, as a general rule, only four typical layouts of construction to be protected. In Fig. 1 *A* it is assumed that the line is highly insulated as compared with the terminal steel structure of the substation or generating station, but Fig. 1 *B* is one in which the line conductors are supported on steel towers or poles and where the substation is insulated much better than the line. In Figs. 1 *A* and *B* it is assumed that the substation or power house is at the end of the line. Fig. 1 *C* indicates a well-insulated line of wood pole construction and, connected to it, a lower insulated steel substation in the middle of the line or a part of it. Fig. 1 *D* shows a steel tower line with the substation of higher insulation than the line. In Figs. 1 *C* and *D* the stations are located in the center or a part of the line and in which a line extends beyond them. In Fig. 1 *A* it is apparent that the arrester should be located close to the steel structure so as to protect the weak link of the combination and its valuable equipment. In Fig. 1 *B* the opposite is necessary, for the reason that the insulation of the line is of lower flashover value than that of the substation, and as a result protection to the line is apparently essential. In this case the high induced potential will not travel far on the line as the substations are materially better insulated than the line and it will flash over and relieve the stress before damage is done to substation equipment. Each insulator support can therefore act as a safety valve. In Fig. 1 *C* it is necessary to locate arresters or drains on each side of the substation equipment in order to have full protection. In Fig. 1 *D*, if the line is to be protected from flashovers, the ideal layout would be to distribute arresters along the line.

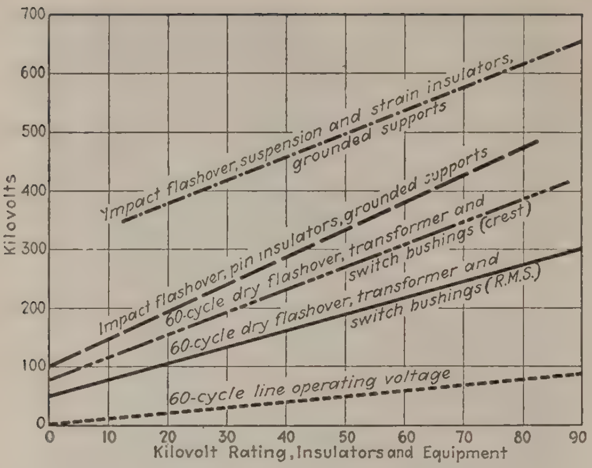

*Fig. 2—Relative values for impact flashovers on lines of 15 kv. to 85 kv.*

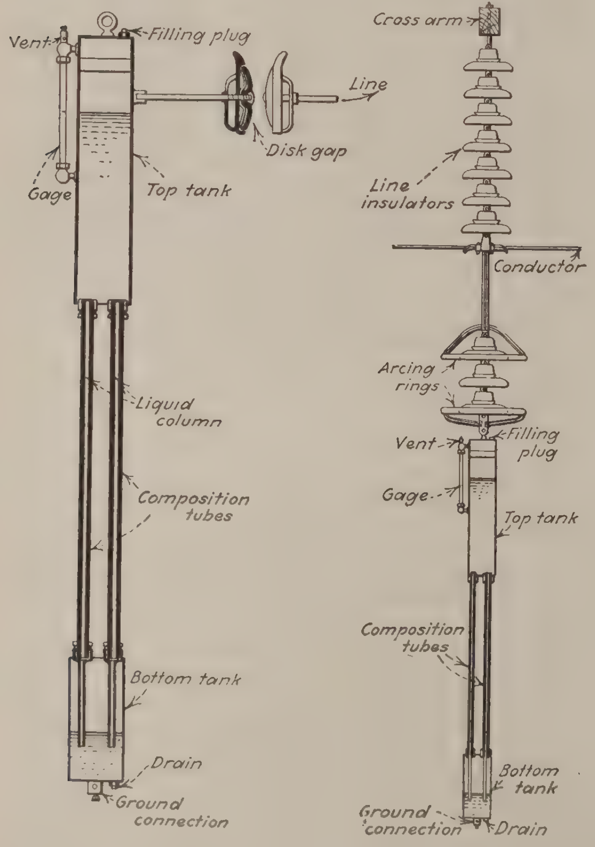
In Figs. 1 *A* and *C* the dead end stations are subjected to more severe conditions than *B* and *D*, as the voltage may rise to double the incoming potential when the transformer acts first as a condenser and later as an inductance.

In simple words, the problem is this: The incoming lightning voltage must be reduced from the impact flashover value of the line to a potential below the flashover of the equipment to be protected.



*Figs. 3 and 4—Details of construction of station type drain device for line protection and installation of line type drain device on a line*

As in Figs. 1 *B* and *D*, distributed drains along the line may prevent frequent flashovers, so detrimental to good operation. The impulse flashover value of the insulation on the line is known and the insulation value of the transformers, the bushings and station equipment is also known. The problem now is to drain the potential from the station if the line insulation is higher than that of the station and to drain the lines if the station equipment is of higher insulation than the line. In the first case it is much easier to protect the station than it is to attempt to protect the line. This applies solely to induced potentials and not direct strokes, as experience has been that it is not economical to protect against a direct lightning stroke.

### Principle of New Protector

A new type of drain has been developed for the purpose of freeing the lines from impulse and high-frequency potentials that are above the normal transmission voltage and frequency. This device has many interesting features, both in its construction and operation. It consists essentially of a high-speed gap and liquid current-limiting resistance columns in series with the gap. The gap is a compensated impulse gap and was described in an article appearing in the Electrical World, May 27, 1922, and subsequently explained again in a paper before the American Institute of Electrical Engineers at the spring convention, April 7, 1924. The gap has the unusual characteristic of having the same arc-over value when wet as when dry, and has a somewhat lower arc-over value under impulse or steep wave-front potentials than for normal line frequency. The gap does not require housing or protection from the weather, since weather conditions do not affect its rating.

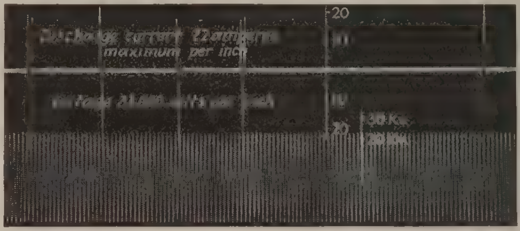


*Fig. 5—Oscillogram showing five discharges on the drain device*

The liquid resistance columns of this arrester act as high-speed current interrupters and function to limit the 60-cycle current that usually follows the high potential discharge over the compensated gap which is connected ahead of the arrester. These liquid columns are connected to tanks at the top and bottom. The tanks contain a solution of calcium chloride which does not freeze above 50 deg. F. below zero. The upper tank has a suitable gage to indicate the amount of liquid in the container and has suitable baffles above it to prevent the liquid escaping when the arrester functions. It is also vented at the top to allow any pressure that might be generated to escape. Connected to the bottom of this tank are two specially constructed composition hose which make the resistance columns and which are not affected by the calcium chloride solution nor by electrochemical action. While two hose sections are usually used, any number of them can be used in multiple, as they function simultaneously while the apparatus is in operation.

The hose for the columns is $\frac{7}{32}$ in. inside diameter and has a wall about $\frac{3}{4}$ in. thick. The lower ends of the hose are connected to the bottom tank, which forms the ground terminal of the device. The lower tank has in it a small air chamber, as shown in the cross-section view, to act as an air cushion and to aid the rapid operation of the device.

The operation of this apparatus in relieving the lines of high potentials is as follows: The impulse potential breaks down the gap and energy flows through the top metallic tank into the reservoir containing the highly conducting liquid and through the hose filled with the electrolyte to the bottom tank, which is, in turn, connected to the ground. If the 60-cycle dynamic current follows over the gap as it usually does, it is cut off by the interrupter action in the hose column. The interruption takes place because a small portion of the electrolyte is changed to vapor very rapidly and this results in a path of high resistance with unstable liquid electrodes on both sides of the vapor. This condition has a very definite and quick interrupting action on the dynamic current. Oscillograph records show that approximately one to two cycles are required to quench the arc at the gap. An oscillograph record of the action is shown in Fig. 5. If a surge is of very large energy content the worst that can happen is the bursting of a hose because of the quickly generated vapor and its resulting pressure effect. For surges of low energy content the resistance column acts as a slow drain for the excess potential.

*Drainage devices of line type installed at 110-kv. terminal station using suspension ring gaps*

Another interesting feature of this arrester is its rapid change in impedance under different voltages, as indicated in Fig. 6. This also shows the relative discharge current under different voltages and impedances. For example, if an impulse voltage of 60 kv. be applied to the arrester terminals the surge impedance of the arrester will be about 430 ohms and the surge current flowing through the arrester will be about 140 amp. Should the impulse voltage be 120 kv. the surge impedance of the arrester becomes about 270 ohms and the surge current through the arrester will be about 445 amp.

Some of the advantages of this type of protective device are as follows:

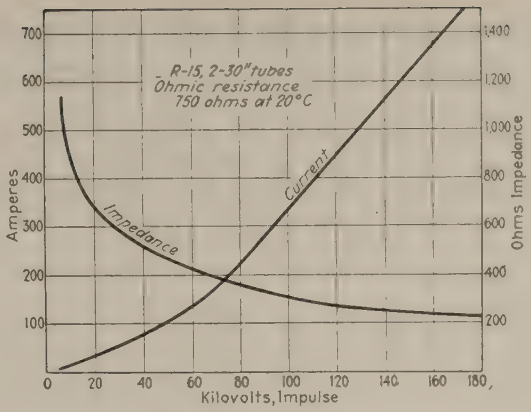

*Fig. 6—The impedance of the electrolyte decreases as the voltage increases*

1. Due to its rather high 60-cycle resistance, the gap is set for only 10 per cent above line voltage, as frequent spillovers are not detrimental to the device. This means less energy to every high potential discharge as the drain acts at low values of surge voltage and tends to prevent an accumulation of charge.
2. The current discharge increases with increase of voltage and does not follow Ohm's law because of the change in impedance of the electrolyte.
3. The surge energy is better dissipated from a system by distributed resistances and, due to low cost, this device is economical to use at short intervals along a line.
4. Any surge impedance to ground that may be desired is possible by adding additional tubes to the resistance column.
5. It cannot be an operating hazard because a broken tube simply opens up the ground connection.
6. It can be tested at any time by short circuiting the gap with an insulated stick.

### General Features of Application

Two general types of this arrester have been developed, the station type and the line type. Assuming a potential gradient of 50 kv. per foot for a line, we have approximately 1,500,000 volts on a line 30 ft. high and

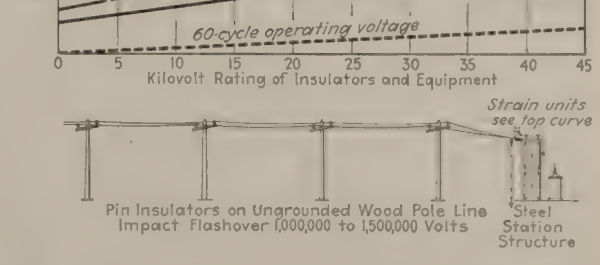

*Fig. 7—Wood-pole line with drainage device installed to protect substation equipment*

steel lines with low insulation will flash over insulators at this value, resulting in bad operation. The line type is designed for installation along the line at intervals justified by the cost of remedying this condition when the several factors involved are considered.

On highly insulated lines, where tapered insulation near the receiving or sending end is desirable, these drains may be used on the approaching two or three tower supports where flat spacing is possible, giving ideal protection to the station and with no operating hazard.

Fig. 7 shows a typical wood-pole line construction with conductors more than 30 ft. above the ground. The impact charge on such a line will reach 1,500,000 volts, providing no weak link in the insulation is present to prevent such a rise. If no arrester equipment is present the weak link for limiting this potential will probably be the dead end strain unit at the substation frame, and this will probably flash over under the circumstances. In this case the device should be connected to the line just ahead of the substation frame in order that full protection be given to the substation by limiting the impact potential to a value below the flashover on all insulators and equipment in the station.

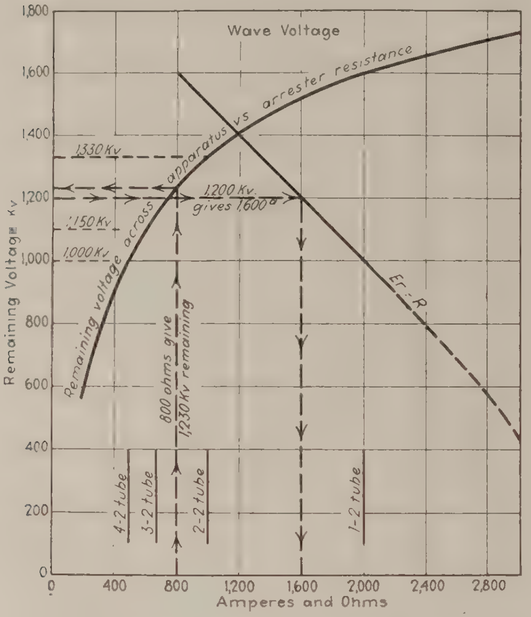

*Fig. 8—Relative effect of multiple electrolyte columns on surge potentials*

It is not necessary to set the gaps widely apart when installed at a generating station where line operating voltages may rise to 150 per cent more due to loss of load or other conditions, as such a rise would only continually discharge the arrester until the governors operated, without harm to the arrester.

The value of low gap settings (10 to 20 per cent above line voltage) cannot be underestimated, as waves with low crest potentials may pass considerable energy by an arrester of wide gap setting before it operates and reach the transformer bushings, having time to charge up the various capacities to ground and causing double potential at transformer terminals.

The much-discussed subject of discharge rate is definitely settled in this new type of drain as its surge impedance values can be lowered by the use of as many multiple tubes in each ground leg as may be desired or required for this purpose.

Fig. 8 shows the relative values for different multiples in reducing a 2,000-kv. wave of two microseconds. For example, if one tube is connected to the line the surge voltage will be reduced to 1,600 kv. and if four tubes were connected in parallel across the line the voltage would be reduced to 1,000 kv.

Where the reduction in voltage for lower insulated lines is necessary the shorter tubes have lower surge impedance and therefore less resistance and more shunting effect. It is well known that the dissipation of transients through resistance in the form of heat is the ideal way of reducing the potentials of harmful surges, and this is accomplished by this device.

## Lighting Rural Highways

LIGHTING of rural highways is a rapidly growing development in the vicinity of Milwaukee. Within the last eighteen months governmental units have arranged with the Milwaukee Electric Railway & Light Company for installation and maintenance of highway lights. Last year Milwaukee County contracted for illumination of prominent highway intersections.

The most significant step, however, has most recently been taken by the town of Lake, a partly suburban and partly rural township adjoining the city of Milwaukee to the south. This township has decided to illuminate every street corner, highway intersection and railroad crossing within its confines. In addition, it will light its main country highways with lamps every quarter mile. The program will make this the most brightly lighted township in Wisconsin. Three hundred and seven lamps are to be installed with a combined brilliance of 124,600 cp.

The illumination program results from the recent action of the town electors in approving establishment of a $200,000 fund to provide "a complete and modern highway lighting system." The fund is expected to finance the cost of such lighting for twenty years. Preliminary work on the new lighting system is already under way and actual installation will be started within a month. The lamps are to be of the incandescent type and arranged in size according to the need of the place to be lighted. Plans call for 81 lamps of 600 cp. each, 130 of 400 cp. and 96 of 25 cp.

## The New 10-Watt Lamp and Central-Station Revenue

By M. Luckiesh
*Director Lighting Research Laboratory, National Lamp Works, Nela Park, Cleveland, Ohio*

IN RESIDENCES the opportunities for using the new 10-watt small-bulb, intermediate screw-base tungsten lamps are largely in the decorative field. However, it has some purely utilitarian uses, such as in night lights, in illuminated house numbers and certain other lighting equipment, in which it is particularly suitable owing to its small physical dimensions. When employed for such purposes the lamps may easily be used about 1,000 hours a year.

Under this condition the 10-watt tungsten lamp competes very favorably with the common household appliances as a revenue producer for central stations. From data which we have available we have determined the number of these 10-watt lamps which should produce as much revenue per year as various electrical appliances. If only "average sockets" are assumed the number of lamps must be trebled.

| No. of 10-Watt Tungsten Lamps | Kw.-Hr. Equivalent |
|---|---|
| 2 | 1 clothes washer |
| 3½ | 1 grill |
| 4 | 1 toaster |
| 7 | 1 iron |
| 4 | 1 percolator |
| 2½ | 1 cleaner |
| 3 | 1 fan |

This apparently insignificant 10-watt lamp opens a new field and it is interesting to note that two of them in "active sockets" in each wired home in this country would increase the central-station revenue as much as the completion of the present iron or washer field to a saturation point.

## Refunding Customers' Deposits

By J. W. Williams

*Director of Public Relations*
*Binghamton Light, Heat & Power Company*

GREATER public confidence and good will have been established by adopting the policy of refunding customers' deposits. This policy was started about a year ago. First, all deposits made previous to 1923 were refunded with 6 per cent interest to all customers who had established their credit by paying bills promptly for the past fourteen months. After this series was refunded, deposits made in 1924 and 1925 were refunded on the same basis. For the present we are continuing to refund deposits on a two-year basis.

The deposits were refunded in geographical order to prevent any run on the local office with inquiries as to why certain customers did not receive a refund while others did so.

A letter is inclosed with the deposit check which has an appended form of deposit release attached, in case the customer has lost the original receipt which was issued when deposit was made. More than $13,000 has been refunded during the past year and more than $3,600 paid in interest. In spite of these refunds the deposits have been reduced only $4,700 over deposits carried a year ago.

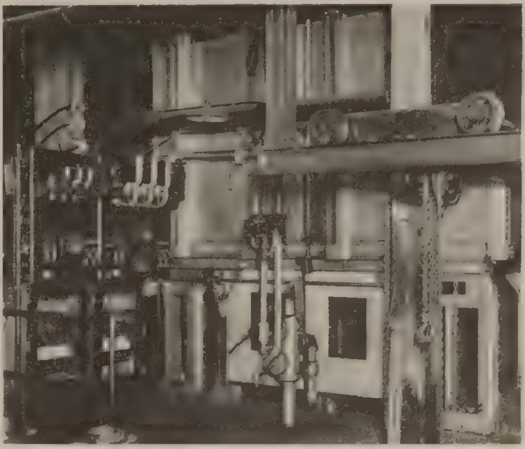
Hundreds of letters have been received commending our policy in refunding these deposits. All express the same sentiment as the few excerpts quoted:

> Thank you for fine service and fair dealings to the rural folks in Willett.
>
> I never did just understand what this deposit was for and had always assumed that it was a forfeit for taking on the light and power. I see now, however, that I was mistaken and apologize for the inadvertent omission of the perspective that should prevail when an individual is permitted by a corporation to do business with an honorable company.
>
> I have made a research in the archives—I don't locate the receipt. If the inclosed receipt is not satisfactory I will refund the six dollars and twenty cents.
>
> I am inclosing receipt for my deposit which you have returned to me.
>
> I cannot pass up the opportunity to congratulate the management of your company on its wisdom in doing things like this, which break down the impersonal attitude that has always been one of the main causes of misunderstanding between public service corporations and the people whom they serve.

In addition to these favorable comments a study of conditions reveals that customers who were in the habit of paying their bills every two or three months are endeavoring to pay bills monthly in order to establish their credit so deposit may be refunded.

## Century Electrically Anneals Lamination Sheets

SOME manufacturers using electric sheet steel for laminations find that they must pay close attention to the kind of steel used and the method of processing after receipt, otherwise the magnetic losses may be more than they should. To secure more accurate and uniform heat treating of the electrical sheets used in the construction of its products the Century Electric Company has recently installed in its plant in St. Louis an elevator-type electric furnace for annealing lamination iron. This furnace was supplied by the Gas Equipment Engineering Corporation. The material cars are moved to and from the furnace by standard squirrel-cage motors. The load is hoisted into the furnace or removed by a hydraulic elevator.



*Elevator-type electric annealing furnace with control panel at left*

While one load of steel is being treated, the next load is prepared so there is little delay between heat cycles. This relatively continuous operation enables the furnace to work at a high efficiency and without the deterioration which comes from alternate heating and cooling when less rapid operation is employed.

The load of hot sheets when removed from the furnace is pushed to the end opposite the loading end and covered with a hood for the purpose of controlling the oxidation of the metal while cooling. Approximately eight hours is required to heat a charge and about six hours for cooling. The two hours' difference between the heating and cooling time is sufficient to carry on loading and unloading with two cars. The furnace will accommodate the car and approximately 6 tons of steel, giving it a capacity of 18 tons daily.

The heating elements are divided into two 75-kw. sections. When the furnace is first loaded the two heating units are operated in parallel until the iron reaches the proper annealing temperature. From that time on the temperature is maintained and radiation losses are offset by one heat element alone. Heat control is entirely automatic, being handled through thermocouple pilots and automatic control panels.

Since the furnace has been in operation it has been found to have four definite advantages over other methods of annealing electrical sheets: (1) Reduced iron losses; (2) increased permeability; (3) less oxidation losses; (4) decreased cost of annealing.

## Financing Street Lighting

"IT IS desirable for central stations to provide two plans for financing street-lighting installations," said L. A. S. Wood at the recent convention of the Missouri Association of Public Utilities, "one for lighting units with overhead construction and the other for lighting units with underground construction. For overhead construction with suspension units a flat rate should be established which would include, besides the operating and maintenance costs, the interest and depreciation on the equipment and its installation. Owing to the comparatively small initial cost of suspension units and overhead construction," said Mr. Wood, "this plan does not impose any undue burden on the annual rate and the fixed charges are reasonably small.

"For underground construction with ornamental units experience has shown that this class of service can best be developed with a flat rate which includes operating and maintenance expenses only, with no provision for interest and depreciation on the equipment which would be installed and financed by the municipality." Mr. Wood recognized a considerable difference of opinion among operating men in regard to the latter plan, but stated that it is quite evident that since the municipality pays its bills out of annual appropriations for street-lighting maintenance the city will have more money available for the purchase of street-lighting service if the street-lighting rate is relieved of the burden of the fixed charges incident to expensive underground construction. In some cases the fixed charges were estimated to amount to as much as 60 per cent of the total rate. Mr. Wood also suggested that when a municipality pays for the installation it is financed by a bond issue, assessment of abutting property owners, public subscription or by some other means, but never out of the annual maintenance budget for street lighting.

*Customer-Owner Growth in California, Utah and Arizona*

## Fundamental Economics of Rural Service Declared

AN ECONOMIC platform for rural service development was recently prepared for the New England Council by the co-operating committee on farm power, headed by Samuel Ferguson, president of the Hartford Electric Light Company, other public utility representatives being F. A. Belden of the Edison Electric Illuminating Company of Boston and J. W. Leland, agent for rural lines Central Maine Power Company, Augusta, Me. Discussion has been invited by the committee from members of the council. The platform follows:

1. It is not economically sound that the rural user should be permanently served at a loss with consequent burden to other customers, nor does the rural customer desire such a subsidy.

This involves one of two alternatives—either the rural customer shall use a sufficient excess of current over the average use to carry the excess line costs or he should pay the fixed charges on the excess of line costs which his service requires.

2. It is not essential that the rural customer should pay his full cost from the start provided his business can be built up to self-sustaining proportions within a reasonable period.

This means, just as in the case of the development of any new business, the existing customers bear the cost of the development period with the expectation of ultimate benefit to themselves.

3. To develop the business to self-sustaining proportions, it is essential that a low price be offered for use of current in excess of the average used by the urban customer, otherwise the cost of liberal use is prohibitively high.

This makes essential the use of a two-part rate having a low energy charge.

4. It is preferable that the customer should not pay any part of the cost of the line extension because his available funds should be conserved for the purchase of electrically operated labor saving machinery. If customers furnish poles and labor, same should be paid for and cost charged to the line.

5. The customer who intends to use liberally should be allowed a resonable time in which to build up his use of current without being burdened at the start with payments as large as a reasonable guarantee would require.

This can be readily accomplished by a graduated guarantee rising from nothing to a self-sustaining figure over a period of five years.

## Letters from Our Readers

### *Resents Indictment of Lower Quality*

*To the Editor of the* ELECTRICAL WORLD:

On page 1019 of the May 19 issue of the ELECTRICAL WORLD there appears a communication entitled "Price Squeezing and Impairing Quality," and as a manufacturer of high-tension equipment we are obliged to take issue with this statement. Price and profits are low, but a charge or even an intimation that all manufacturers are lowering their quality is untrue and we will not submit to such an indictment.

In this highly competitive era the only way to meet conditions is to improve a product steadily and at the same time, by means of improved methods, reduce its manufactuing cost. The manufacturer who is not doing this today is a horse and buggy traveler on a high-speed highway and bound to trail behind. The manufacturer who blindly tries to produce equipment under the same conditions his "Uncle Ezra" did ten years ago, in the days of long profits, is pretty close to the border line of industrial sensibility.

As for us, full steam ahead with better and better equipment.

H. W. YOUNG,
President.

Delta-Star Electric Company,
Chicago, Ill.

# Digest of Electrical Literature

## *Transmission, Substations and Distribution*

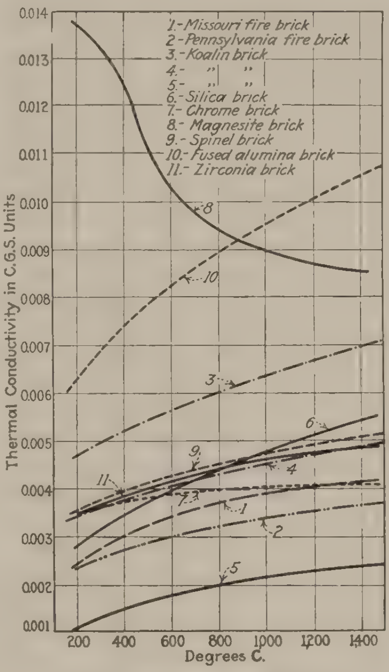
*A.-C. Substation Design Practice—1927.*—The principal features of alternating-current substation practice among the member companies of the N.E.L.A. as evidenced by stations designed or constructed in the period following the release of a similar report for 1925 are covered in this discussion. The subject has been divided into three sections: Attended transmission, attended distribution and full automatic substations. Simplified plans, cross-sections, one-line diagrams, use of electrical equipment and devices and tabulations of substation details are included. Among the indicated tendencies are: An increasing use of automatic substations; segregation of equipment operating at lower voltages; the use of three-phase, four-wire, 4-kv. circuits for distribution involving several varying practices for switching and operating work; appreciation of the reliability and operating advantages of self-cooled transformers, and a definite tendency toward outdoor substation design. —*Serial Report National Electric Light Association*, April, 1928.

*Design Theory of the Transformer.*—M. Vidmar.—The author claims that all known theories of transformer design suffer under the inaccuracy involved in determining exactly the fill-factors of iron cores and windings. To eliminate these, a new method is presented in this paper, in which iron and copper are introduced by weight only. To obtain the most economic design certain definite ratios must be maintained between dimensions, losses and costs. These ratios are mathematically derived in a logical manner and lead to the final conclusion that the expenditures for active materials in a transformer become a minimum when the cost of the iron core is as much higher than the cost of the winding as the losses in the copper are greater than the iron losses.—*Elektrotechnik und Maschinenbau*, April 15, 1928.

## *Hydro-Electric Development and Steam Equipment*

*Fluid Governors for Prime Movers.*—Henry F. Schmidt. — The pressure-volume characteristics of the three well-known types of centrifugal pump runners offer the basis for this discussion of fluid governors. This article, which is one of a series, offers a consideration of the effect of temperature and atmospheric pressure; methods of compensating for physical characteristics of media; method of supplying fluid to the pumps, and similar factors of significance in such work. It is stated that for ideal conditions the governing device itself should be mounted on and be a part of the main turbine shaft without the intervention of gears, links or moving parts. No sliding parts between the governor and the valve-operating mechanism should be included; the connection between the rotating and stationary parts should be through the oil pumped by the impeller.—*Electric Journal*, May, 1928.

*Properties of Refractories and Their Relation to Conditions in Service.*—Stuart M. Phelps.—An analysis of the physical properties of various refractory materials and their service characteristics has been prepared by the author. The results of a number of investigations have been compiled and tabulated with particular reference to strength, resistance to destruction and confinement of heat properties. The resistance to destruction has been classified to include abrasion, slagging, spalling and melting of the material.—*Transactions of the American Society of Mechanical Engineers*, January-April, 1928.



*Relative thermal conductivity of refractory materials*

*Peak-Load Equalization in Power Plants by Ruths Steam Accumulators.*—J. Tobolla.—The influence of fluctuating loads upon the economy of steam and water-power systems is discussed with special emphasis on the question of amortization and interest charges. The author has directed particular attention to the economic value of the steam accumulators of both the variable pressure and constant pressure type.—*Journal of the Institute of Electrical Engineers of Japan*, April, 1928.

## *Units, Measurements and Instruments*

*Electro-Dynamometer with Nearly Uniform Scale.*—D. I. Bubert.—Electro-dynamic voltmeters or ammeters have a stationary and a moving coil. Passing the measured current through these two will cause attraction, which is proportional to the product of current times field density, or the torque in any one point is proportional to the square of the measured current. The scale of such instruments will therefore be a quadratic division. By winding the stator coils in a peculiar, irregular moon-shaped cross-section, embracing completely the path of motion of the rotor coil, the author succeeded in so distributing the stationary field as to make the torque almost directly proportional to the passing current. The new instrument has 172.5 amp. turns on the stator and 15 amp. turns on the rotor coil. The 150 voltmeter consumes 0.9 watts. Neglecting the difference of one-tenth per thousand, the calibration is the same for alternating current or direct current. —*Elektrotechnik und Maschinenbau.*—April 22, 1928.

*Oscillating Meters.* — D. Broido. — Direct-current watt-hour meters, based upon the oscillating principle, were among the first to achieve practical use. Their great simplicity and approximately nine times longer life prompted designers in recent years to improve and to modernize them, with the result that a new line of oscillating meters is now available, exceeding in accuracy the established motor type meters. While this new model can be made to operate either across a shunt or directly in the line, it is the latter application where the new meter excels. Models for up to 10,000 amp. are available, which can be mounted directly upon the busbars, with no interruption of the bar. A 5,000-amp. meter starts at 30 amp. and has an inaccuracy of less than plus ½ per cent. Simplicity of mounting, no watt loss in a shunt, practically no temperature correction, readily possible recalibration and a maximum of measuring accuracy are the chief advantages of this new type.—*Elektrotechnische Zeitschrift*, April 19, 1928.

## *Illumination*

*Four Fundamental Factors in Vision.*—Percy W. Cobb and Frank K. Moss.—An experimental analysis of the quantitative interrelation of four characteristic variables of the visual object at the border of visibility, with a discussion of the applicability of the results in lighting practice which aims at clear vision. The four fundamental variables in a visual object as developed by the authors in this discussion are the size of its critical detail, conveniently expressed as minutes visual angle subtended at the eye by the detail; the contrast between the object and its background, which may be defined as the ratio of the brightness-difference to the brightness of the background and for simplicity designated as per cent contrast; the brightness-level to which the object is illuminated, and the time during which the image of the object is allowed to rest upon the retina of the eye.—*Transactions of the Illuminating Engineering Society,* May, 1928.

*The Manufacture and Properties of Glass and their Application to Illuminating Engineering.*—S. ENGLISH.—The various properties of glass as related to its lighting application have been considered by the author with particular reference to the factors of transparency and color, diffusion qualities, opalescence and frosted coating.—*Journal of Good Lighting (England),* May, 1928.

## *Motors and Control*

*Synchronized Asynchronous Motor.*—J. L. MONNIER.—A French steel manufacturer has installed a 2,000-hp. synchronized induction motor for the direct drive of a six-pass blooming mill. The machine has a normal speed of 167 r.p.m. and is directly connected to a 600-amp., 60-volt direct-current exciter. Overloads of up to 4,000 hp., such as may occur during the rolling process, can be readily delivered without the danger of falling out of step. Considering only the mechanical output of the motor, an efficiency of 92.8 per cent can be reached. But since the motor can furnish simultaneously up to 1,200 kva. reactive power, correcting the phase displacement caused by other motors in the mill, an electric efficiency of 94.7 per cent has been recorded. Characteristic curves and vector diagrams are given to explain the exact operation of this motor, which is claimed to be the largest of its kind.—*Revue Générale de l'Electricité,* April 21, 1928.

## *Heat Applications and Material Handling*

*Molybdenum Furnace.*—P. W. DÖHMER.—Platinum begins to evaporate at a temperature of slightly more than 1,300 deg. C. If higher degrees of heat are required for certain chemical or electrometallurgical investigations heating units of platinum wires cannot be used. A German concern has found molybdenum wire to be suitable for temperatures up to 1,500 deg. C., provided the surface of the wire is prevented from oxidizing. It was customary to establish around the heating unit an atmosphere of hydrogen or water gas, but methods of supplying these gases and making necessary hose or pipe connections were found cumbersome. The new method provides on the furnace a small vessel with methylated alcohol. This liquid is made to drip slowly through a heated tube, in which it is evaporated, and the vapor so formed provides a steady stream of protecting gas around the molybdenum heating unit. One filling of the vessel is sufficient for an operation of two hours. The gas escapes through an exhaust tube and burns with a non-luminous flame. The maintenance of this flame is an indication of the proper functioning of the evaporator.—*Zeitschrift des Vereines Deutscher Ingenieure,* April 28, 1928.

## *Electrophysics, Electrochemistry and Batteries*

*The Drying and Storage of Secondary Battery Plates in the Charged State.*—SAKEE MAKIO.—The results of a preliminary investigation to be applied to a general research on the best methods for preparing secondary battery plates fully charged in the dried condition are given in this report. A successful process of this kind, it is stated, will serve certain useful purposes, namely, the transportation of the battery without electrolyte and the saving on the part of the purchaser of the battery of applying the first charge to it. A number of positive and negative plates were fully charged, washed and dried in carbon dioxide gas, wrapped in paper and stored for six months. The tests upon which this report is based were made indicating the characteristics of these dried plates. Voltage time curves, specific gravity time curves and temperature time curves of the cell were studied upon immersing the plates in the electrolyte.—*Report of the American Electrochemical Society,* April, 1928.

*Electrochemistry and Electrometallurgy.*—W. W. E. FRENCH.—The electrothermal processes used in the fixation of nitrogen and in the manufacture of nitrogen products have been classified under electric arc process, the calcium cyanamide process and the synthetic ammonia process, while the electrometallurgy of iron and steel and of the ferro-alloys and non-ferrous metals have been offered a separate consideration. Electrolysis and the electrolytic refining of metals have also been considered.—*Journal of the Institution of Electrical Engineers (England),* May, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*High Angle Radiation of Horizontally Polarized Waves.*—S. UDA.—The results of experiments made to determine the directional property of horizontal antennas with special reference to the high angle radiation of horizontally polarized short waves have been described by the author. In these experiments short waves of 260 cm. length were employed and the sending antenna of nearly a half wave in length was placed horizontally above the ground. The receiving antenna forming a Hertz's resonator was also supported horizontally and made to move up and down along a vertical line by means of a pulley device The field intensity due to the horizontal antenna was measured in various angular directions above the ground by placing the receiver at various heights. It is concluded that if several wave directors are arranged in front of the radiating antenna along an inclined line, making a certain angle with the horizontal, the radiated energy along this line will become greatly augmented, due to the existence of wave directors, and the direction of maximum radiation will not strictly coincide with the line of directors, but will be of a somewhat higher angle than this line. It is stated that the sharpness of the beam can be much improved by increasing the number of wave directors.—*Journal of the Institute of Electrical Engineers of Japan,* April, 1928.

## *Miscellaneous*

*Electric Purification of Blast Furnace Gases.*—M. KERALY.—Exhaust gases from blast furnaces represent a considerable calorific value and can be used for heating purposes or as fuel for internal combustion machines. The large amount of dust carried by these gases makes their direct use impossible. A thorough filtering process has to be carried on, to remove from 6 to 50 grams of solid matter from every cubic meter of gas. This represents a total of about 50 tons of dust per day from an iron output of 220 daily tons. Mechanical filtering processes are cumbersome, require water and are not thorough enough. The article describes modern electric dust precipitation with rectified 50,000-volt alternating current. Several installations on a large scale have demonstrated excellent results with a minimum of attendance. The purified gas does not contain more than an average of 0.013 grams of dust per cubic meter; that is, the precipitation removes up to 99.8 per cent of the solid contents of the gas.—*Bulletin de la Société Française des Electriciens,* Vol. 78, 1928.

*Unusual Features in the Microstructure of Ferrite.*—HENRY S. RAWDON and TORKEL BERGLUND.—Ferrite in the form of electrolytic iron, open-hearth iron and wrought iron is usually considered to have a very simple microstructure, but sometimes shows rather unusual features indicating that it may exist in various allotropic forms. It is stated by the authors that two of these features apparently related to the delta and gamma form of iron can usually be associated with tiny inclusions distributed in such a manner as to record the grain structure which existed in the high-temperature allotropic condition. A thorough investigation of the microstructure of ferrite has been undertaken and the factors affecting the material, including casting, heat treatment and mechanical deformation, have been considered, as well as the effect of "working" irons of different compositions. The results of tension tests of open-hearth iron at elevated temperatures and miscellaneous factors effecting the "veining" of the material are discussed.—*No. 571 Scientific Papers of the Bureau of Standards.*

# News of the Industry

## Promotional Rate Is Made General at Boston

*Department of Public Utilities Modifies Boston Edison Company's Schedule B and Applies It to Domestic Customers in Metropolitan District*

DOMESTIC consumers of electricity on the Boston Edison company system will save about a million dollars yearly, according to a decision of the Massachusetts Department of Public Utilities handed down on Wednesday of this week. Customers in Watertown, Somerville, Chelsea, Roxbury and other localities recently petitioned for a reduction in residential service rates. After a series of hearings the commission has reached the conclusion that the establishment of a zone rate would be undesirable at present; that if a flat reduction in the present maximum rate of 8.5 cents per kilowatt-hour were to be ordered, only 0.5 cent could be cut off, and that the proper course is to modify the company's so-called domestic lighting and appliance rate (Schedule B) so that the consumers and the company may enjoy in greater degree the advantages of an inducement-type rate.

Accordingly the board orders that after Aug. 15 the company's Schedule B shall be available for lighting and other domestic uses in residential premises, excluding hotels and apartments where the bills are not rendered by the company directly to the individual tenants. Under this schedule as modified by the board the rates are to be 8.5 cents per kilowatt-hour for the first 2 kw.-hr. per month per 100 sq.ft. of floor area, 5 cents per kilowatt-hour for the next 70 kw.-hr. per month and 3 cents for the excess, the minimum area being 1,000 sq.ft. This indorsement of the inducement-rate principle is regarded as highly important in Massachusetts utility circles. Various points discussed by the commission will be covered more fully in a later issue.

## Elephant Butte Contract for El Paso Company

Following the withdrawal by the Texas-Louisiana Power Company of its proposal to construct a hydro-electric plant at Elephant Butte Dam, the boards of directors of the El Paso County Water Improvement District and the Elephant Butte district in New Mexico have signed the contract submitted by the El Paso Electric Company, subsidiary of the Stone & Webster interests, providing for the development of hydro-electric power at the dam. A co-operative agreement between the Elephant Butte and El Paso districts will be worked out at once, after which the contract will be submitted to the water users for approval. The Secretary of the Interior must also sign the contract.

A lease with the government for the development of power by the districts for a period of 50 years also was signed by the board of directors. It provides that after all expenses have been deducted in operating the plant the amount left shall be applied on the current bill of the districts to the government. M. H. Lewis & Company, Huntley & Company and the Merchants' National Bank of Los Angeles have submitted a proposition for financing the project. It is expected that the plant will be constructed speedily so that delivery of power can be started about the middle of next year.

## Lightning on Conowingo Line "Never Touches" Service

A report from engineering sources says that the first real test of the Conowingo transmission system under lightning disturbance was had on Tuesday night, June 5, when what was apparently a direct stroke hit the line near Philadelphia about 10:30 o'clock. The steam units at Philadelphia took up the load immediately, it is reported, probably without more than a dip in lamp voltages. Conowingo at the time was delivering 185,000 kw., of which 150,000 kw. was being transmitted to Philadelphia. Apparently all the relays and governor equipment concerned functioned 100 per cent, and Conowingo was on full service again in ten minutes.

## Two Years' Growth of the N.E.M.A.

### Executives of Association and Delegates to Annual Meeting at Hot Springs, Va., Evince Satisfaction with Outlook for Its Growth and Usefulness

MORE than three hundred electrical manufacturers gathered at Hot Springs, Va., this week to attend the annual meeting of the National Electrical Manufacturers' Association. Though this organization is less than ten years old, it already has proved its value both to the manufacturers and to the entire electrical industry. In making this assertion President Gerard Swope declared that the manufacturing industry is now co-ordinated and articulate and that the N.E.M.A. is a necessary organization. He urged patience and still more patience in the development of the body, quoting figures and facts to show that the membership was increasing and that important work had been completed or started. Each of the divisional vice-presidents reported progress and expressed firmly a belief that the new organization is working out most successfully. A. E. Waller, the managing director, reported a good year. He said the headquarters staff had been increased to give engineering aid to the work of the association and emphasized the importance of section activities.

The five days at Hot Springs were devoted almost entirely to section meetings where men in each group of manufactured products discussed standardization, basic business policies and organization procedure. These meetings were well attended and much progress was made. There was only one general meeting. At it the addresses just alluded to by President Swope, Managing Director Waller and the vice-presidents of the divisions were made. Vice-President Clarence L. Collens of the Policies Division stated several national business policies which this division had discussed and stressed the elements of policy involved in the tariff and in legislation on industry and the interrelations of the N.E.M.A. with other industry groups.

According to the reports of the executives, the Apparatus, Radio, Supply and Appliance Divisions have much work under way and look forward to substantial achievements during the coming year. Standardization, cost accounting, industry statistics and market development were put forth as common objectives. W. E. Sprackling reported very favorably on the work of the Industry Trades Conference.

H. B. Crouse was elected president for the coming year. The divisional vice-presidents elected were as follows: Apparatus, N. A. Wolcott; Appliance, M. C. Morrow; Policies, C. L. Collens; Radio, L. B. Raycroft; Supply, W. E. Sprackling. Members of the board of governors elected for three years were H. B. Crouse, R. Edwards, A. L. Eustice, Otto H. Falk, W. L. Jacoby, J. M. Curtin, D. H. Murphy, R. J. Russell and Frank E. Wolcott. I. A. Bennett was elected a member of the board for one year.

## Radio Division, N.E.M.A., Has Session at Chicago

Meeting at Chicago on June 4 to 7, the Radio Division of the National Electrical Manufacturers' Association went on record as favoring the early adoption of the engineers' plan of broadcasting allocation by the Federal Radio Commission and the increased use of higher power by broadcasting stations. Publication of "The Radio Market," a comprehensive statistical compilation, was announced.

A feature of the meeting was a speech by Representative Clyde Kelly of Pennsylvania, joint author of the "fair trade" bill, which is aimed at "cut-throat competition encouraged by unjustified application of anti-trust laws."

## Cullinan Re-elected Chairman of Electrical Wholesalers

George E. Cullinan, vice-president of the Graybar Electric Company, was re-elected chairman of the executive committee of the electrical wholesalers at their twentieth annual convention, held at Hot Springs, Va., last week. A report of the convention, where the name of the association was changed from the Electrical Supply Jobbers' Association to the National Electrical Wholesalers' Association, appeared on page 1260 of last week's ELECTRICAL WORLD. Edwin M. Keatley was elected vice-chairman, succeeding L. T. Milnor of the Milnor Electric Company, Cincinnati. Mr. Keatley is president of the Virginian Electric, Inc., Charleston, W. Va.

## Six Thousand to See Artistic Lighting Exhibit

Upward of a million dollars' worth of the most modern of lighting fixtures and accessories were shown at the national lighting equipment exhibition held in connection with the convention of the Artistic Lighting Equipment Association at the Hotel Sherman, Chicago, June 11 to 15. With registration of delegates in excess of two thousand on the second day, indications were that visitors would reach a total of five or six thousand by the end of the week, making this the best attended exhibit yet staged by the association.

Lighting equipment was displayed by 125 or more manufacturers, and the design of fixtures showed many advances and changes in styles both in the finer grades and in moderate-priced lines. A trend toward modern and exotic art was apparent in some styles of wall fixtures and table lamps, while adaptations of period styles and more liberal use of color were much in evidence. Visiting dealers expressed themselves as well pleased with the exhibition, which, being held in the summer, affords ample opportunity to prepare for the busy fall.

During the convention the different manufacturing groups held meetings on Tuesday, Wednesday and Thursday. On Tuesday evening the Chicago sections of the Illuminating Engineering Society and Artistic Lighting Equipment Association held a joint meeting and dinner, at which Prof. H. H. Higbie, past-president of the I.E.S., addressed the meeting on "Practical and Proper School Lighting.

# Load Building Uppermost at Pasadena

### Pacific Coast Electrical Association Holds a Unique Convention in Southern California City, in Which Playlets, Pictures and Employees' Oratory Play Part

LOAD building was the theme that dominated the twelfth annual convention of the Pacific Coast Electrical Association (geographic division of the N.E.L.A.), held at the Huntington Hotel, Pasadena, Cal., June 12 to 15. President W. L. Frost, in addressing the six hundred delegates, pointed out that the industry has before it the greatest load-building opportunity in its history and said that now the problems of engineering and production have been solved the industry must squarely face its selling problem. He saw little to fear in the investigation of the Federal Trade Commission and said that the industry can confidently stand upon its record, a record of improvement in service, constant reduction in rates and fair dealing with the public.

The convention was unique in that many of the committee reports were presented in "skit" or picture form and the program was dramatized and animated throughout. A three-minute speaking contest held at a luncheon on the first day was of unusual interest. Six young men and women of the industry displayed an unusual grasp of the selling problem in their addresses on the subject "Electricity Is Cheap—Use More of It." A prize of $100 went to the winner in this contest, and the expenses of all to the convention were borne by their employers.

An innovation in convention programs was a contest between the Accounting, Commercial, Engineering, Transportation and Purchasing and Stores sections to see which could make the best demonstration of how it could assist in load building. Able presentations were made by all, some by slides, some by playlets and some by motion pictures, and all were dramatized. A prize of $100 was to be awarded to the winner on the last day of the convention.

At the one meeting of the Engineering Section F. M. Farmer, chief engineer of the Electrical Testing Laboratories, New York, took his audience on an illustrated "word trip" through the testing laboratories and pointed out the value of the co-operative work carried on by the organization, which he said really supplements the laboratories maintained by various manufacturers and utility companies. Irl C. Martin of the Woodward Governor Company described the requirements and functioning of governing equipment.

Wednesday afternoon, at a general session, reports of the public speaking, industrial relations and customer relations committees were presented, and the winning essay in the contest conducted by the customers' relations bureau was presented by the author. Addresses by Ruth E. Creveling, Eloise Davison and Clotilde Grunsky dealt with the very creditable work which the women's committee is doing and the excellent organization which has been built up to conduct this work.

Officers of the association for the ensuing year, elected at the business meeting which opened the convention, are: President, P. M. Downing, Pacific Gas & Electric Company; first vice-president, E. B. Griddle, Southern Sierras Power Company; second vice-president, A. M. Frost, San Joaquin Light & Power Corporation. The convention was to conclude with general sessions on Thursday and Friday.

## Federal Trade Commission Enters Texas

*Questions Director of Information Bureau Concerning Newspaper and School Activities in That State—Ballinger and Blain Also Testify*

TEXAS had its turn when the Federal Trade Commission resumed its investigation of the public utility companies on Tuesday of this week. William C. Grant, director of the Texas Public Service Information Bureau, a newspaper man still retaining a connection with the Associated Press, told of the bureau's activities. He informed the investigators that he had furnished news items, "feature stories" and occasionally editorials for newspapers and admitted that drafts of two or three editorials which he wrote for the Dallas *Times-Herald* had been submitted to executives of Dallas utility companies before publication.

The witness, under questioning from Mr. Healy, the commission's counsel, said that the bureau had prepared a set of four pamphlets dealing with public utilities for school distribution and last year had circulated 20,000 sets, or 80,000 copies. Of the 1,000 high schools in the State of Texas, he said, 350 had made requests for copies of the pamphlets.

Throughout the testimony Mr. Grant asserted that the purpose of the Texas Public Service Information Bureau was to give the people of Texas the facts regarding the public utilities, and he denied that it was "a propaganda organization" unless the commission's counsel saw fit to include as propaganda "about 75 per cent of all that is published in newspapers" on all subjects of business activities.

"Isn't the prime purpose of your committee to put out information against government ownership such as is provided in Muscle Shoals and the Boulder Dam project?" asked Mr. Healy.

"We conceive it to be our duty to give the public the facts," said the witness, "If the public utilities don't give the public the information on these subjects, the public has no place to get the information."

The information bureau, Mr. Grant said, got about $16,000 to $18,000 annually to spend from the public utility companies of Texas.

On Wednesday C. W. Davis, chairman of the Texas bureau, told about the contacts made by his bureau with Texas colleges. He testified that the Texas Agricultural and Mechanical College was used by the Southwestern association as an agency through which a survey of rural electrification was made by John E. Waggoner. Documents introduced into the record showed that in 1927 the association spent $3,241 for the survey and that in 1928 the survey expenses have amounted to $5,419. Mr. Davis said that the money was paid to the college, which turned the funds over to Mr. Waggoner.

S. J. Ballinger, secretary of the Southwestern Division of the N.E.L.A., said his organization planned to spend $20,000 this year on public relations work. He said that it already had paid the expenses of a meeting of professors called by Dean C. O. Ruggles, formerly of Ohio State University, at New Orleans to discuss utility courses in colleges. He added that the expenses of many professors to this gathering had been paid by the organization.

Hugh M. Blain of New Orleans, director of the Louisiana-Mississippi Committee on Public Utility Information, declared that T. H. Harris, Superintendent of Education for Louisiana, granted him permission on Dec. 13 last to distribute thousands of utility pamphlets to the schools in that state. He added that the pamphlets were welcomed in the schools of Louisiana.

Mr. Healy at this session produced two canceled checks for $2,500 made out to the Fuel, Power and Transportation Educational Foundation of Ohio, which bore the indorsement of that organization and that of S. S. Wyer, who made an unfavorable survey of the Ontario Hydro-Electric Power Commission's system about three years ago. The checks were drawn by the National Electric Light Association. Mr. Healy's object was to try to show that the N.E.L.A. was concerned with financing the survey—a matter previous testimony was thought to have left uncertain.

## Santeetlah Plant Almost Ready for Aluminum Company

The Santeetlah hydro-electric plant in North Carolina on the Tennessee border, which will rank with the largest hydro-electric projects in the South, will go into operation soon, officials of the Tallassee Power Company, its builder, announce. Actual construction work was completed and water turned into the dam on Dec. 7, but it has taken the intervening time to fill the reservoir, which covers an area of approximately 3,000 acres with a 100-mile shore line. The dam is 202 ft. high at the highest point and more than 800 ft. long. A system of tunnels and pipe lines, nearly five miles of which is under mountains, has been constructed to carry the waters in a fall of approximately 600 ft. to a power house with two generating units on the south bank of the lake formed by the Cheoh Dam on the Little Tennessee River.

This project will develop 66,000 hp. and is the second unit on the generating system planned by the Aluminum Company of America at Alcoa, Tenn., where the power will be used. That company's power projects will entail an expenditure of $20,000,000 when completed. It is understood that plans are already under way for an expansion of its manufacturing plants at Alcoa in order to utilize the power from the Santeetlah Dam and also from the Calderwood Dam when it is completed next year.

## Purchases and Mergers

*Control of Rochester Gas & Electric Corporation Passes from New York Central Railroad to Phillips Interests with Mohawk Valley Company*

ANNOUNCEMENT was made at New York on Wednesday, June 13, by A. H. Harris, chairman of the executive committee of the New York Central Railroad Company, that that company had concluded negotiations for the sale of its controlling holdings of the stock of the Mohawk Valley Company of Rochester at $75 per share and of its controlling holdings of common stock of the New York State Railways, which owns Rochester and interurban transit lines, at $25. The announcement did not include the name of the purchaser, but subsequent news from the office of the Long Island Lighting Company in New York confirmed a statement made in Rochester that E. L. Phillips, president of the Long Island Lighting Company, and his associates were to be the new owners. The total sale price is figured at $41,758,325.

The Mohawk Valley Company has for its chief subsidiary the Rochester Gas & Electric Corporation. It also controls four smaller companies—the Cooper Electric Corporation and the Hilton Electric, Light, Heat & Power Company, both of Hilton; the Geneseo Gas Light Company, which does a light and power business, and the Mount Morris Illuminating Company. The Rochester Gas & Electric, capitalized at more than $60,000,000 and with 72,000 kw. in steam-electric and 34,000 kw. in hydro-electric equipment, ranks among the chief upstate light and power organizations. Robert M. Searle is the president.

Mr. Phillips announced that the minority stockholders of the acquired companies have the privilege of accepting the same terms as the railroad or of receiving securities in a new company to be formed in exchange for their present holdings. The new company will take over the Mohawk Valley properties and contiguous properties already owned by the Empire Power Company, bringing into a single organization electric and gas properties in New York State having an aggregate value in excess of $150,000,000, among them being the New York Central Electric Corporation, which in turn controls the Empire Gas & Electric Company; the Seneca Power Corporation and the United Gas & Electric Corporation.

Capitalization of the many small utility companies—largely light and power—which, as noted last week, the Pennsylvania Power & Light Company is seeking authority to merge with itself is placed at more than $13,000,000 in the application pending before the Pennsylvania Public Service Commission. The largest of the companies to be acquired if the company's plans are approved, the East Penn Electric, is capitalized at more than $6,500,000, the Panther Valley Electric at $720,000, the Juniata Public Service Company at $300,000, the Hummelstown Water & Power Company at $200,000, the Franklin Township Carbon Electric Company at $110,000, and the Schuylkill Electric Company at $100,000. About ten of the other companies are "paper" concerns. The total price to be paid for the properties was put at $56,000,000 and their value as $63,000,000.

Some weeks ago newspapers announced the purchase by the Georgia Power Company of the Winder (Ga.) municipal electric plant for approximately $300,000, the company to pay part of the price in cash and assume the bonded indebtedness of the city. This announcement was premature, since the arrangement provided that the plan must be submitted to the voters if a certain proportion of them signed a petition to that effect within three weeks after the proposal had been advertised. The time set having expired without such action, the Winder plant is now to be taken over.

The Southern Public Utilities Company has been negotiating with the Town Commissioners of Huntersville, N. C., for the purchase of the electric lighting system, and an election will be held to determine whether or not the town shall sell.

The New York Public Service Commission has authorized the Mohawk-Hudson Power Corporation to acquire control of the common stock of the Cortland County Traction Company, which operates an electrical distributing system.

The Western Light & Power Company is reported to be negotiating for the municipal power plant at Woodward, Okla.

An offer of $90,000 for the Medicine Lodge (Kan.) municipal electric plant has been made to the City Council by the Western Light & Power Company, with headquarters in Salina. The company's offer includes a rate reduction and an agreement to retain and operate the plant on a part-time basis. The Kansas Power Company, Topeka, has entered a proposal for the purchase of the municipal distribution system of Glen Elder, Kan. The city now receives service from that company. The same company's offer to purchase the municipal distribution and street-lighting system of Natoma, Kan., was defeated by a small majority. Negotiations are under way for the sale to the Kansas Power & Light Company, Topeka, of the distribution system of Everest, Kan., supplied with electricity from the Atchison district of the company. Sale of the municipal distribution system of Circleville, Kan., to the Kansas Power & Light is announced. Circleville formerly received its electric service from the municipal plant at Holton.

# "Electrical World's" London Letter

## Development of Transatlantic Radio Telephony—Engineers and the New Overhead Line Regulations—Grandmotherly Restrictions—To Check Shoddy Wiring

BY BERNARD C. HOLDING
Editor of *The Electrician*

LONDON, June 1.

THE penning of this written monthly link between England and the United States of America reminds one of the progress which continues to be made in the development of another, and immeasurably quicker, link—the transatlantic radio-telephone service, the use of which is increasing at a rate so satisfactory that one London hotel with a large American clientèle has spent for its clients nearly $23,000 in nine months on transatlantic calls.

An outstanding event of recent weeks has been the long-awaited issue by the Electricity Commissioners of the new overhead line regulations. The dissatisfaction which has been expressed as to the unnecessary restrictions imposed by the old regulations has been so vocal, and their effect on line construction here has been so obvious to visitors from the United States, that you cannot fail to be aware of the importance which electricity supply authorities in this country attach to this question. Following frequent representations pointing out the unduly conservative requirements contained in the old regulations, hopes were entertained that substantial relief might be forthcoming. Actually, however, the degree of amelioration afforded cannot be regarded as other than slight. For instance, there has been no reduction in the factors of safety, either for supports or for conductors. Despite the fact that reinforced-concrete supports are finding increasing employment in many countries, the new regulations still require a safety factor of three and one-half for these supports. As the figure for iron or steel is two and one-half, it seems that it must be assumed that reinforced concrete is weaker than one of its constituent parts—a proposition that would puzzle a modern Euclid. Another irksome condition is that requiring the use of duplicate insulators to support conductors erected along a public road or canal or within 50 ft. thereof.

As has been seen in the above and in earlier instances, the development of electricity supply in this country is still hedged about with grandmotherly restrictions, and nowhere is this more obvious than in connection with the obtainment of rights-of-way for overhead lines. Matters have indeed become so bad that the Overhead Lines Association has held a special meeting to discuss the possibility of obtaining a standardized form of agreement. As the result of this discussion some concrete—not reinforced—proposals will probably be offered to the Electricity Commissioners.

The opinion that the new regulations will not afford a great deal of relief to electricity supply authorities is fairly general, though some engineers, including Borlase Matthews, president of the Overhead Lines Association, have recently stated that the new rules will permit a reduction of from 12 to 30 per cent in the cost of these lines.

Engineers concerned are also keenly feeling the need of some standard of overhead erection practice and materials. There is at present no definite ruling as to the spacing of conductors relative to sag. Then there are various devices for earthing fallen wires on low-tension lines, all with their individual good points—but no standard. Other directions in which the need for standardization is felt include types of poles and the sizes of stay wires and stay blocks. With regard to reinforced-concrete supports, it is understood that the Electricity Commissioners are continuing their consideration of the possibilities of this material, as the result of which it is hoped there will be some modification of the ridiculous factor of safety which is now applied to this form of construction.

The National Register of Electrical Installation Contractors—an independent professional authority which exists to protect the public from shoddy wiring, by registering contractors who can produce satisfactory evidence of experience and ability—recently held its third annual meeting, when it was disclosed that 1,066 electrical contractors are now enrolled. The Register is being much discussed in contracting circles, it being felt that the existence of a large number of shoddy wiring installations affords a strong reason for making the existing voluntary registration scheme into a compulsory one. With one section of the industry clamoring for the removal of restrictions and another fervently demanding restrictive ordinances, we have a curiously contrasted picture. At present there seems little likelihood that either will receive full satisfaction.

A young body which, except indirectly, is less fettered by regulations is the Electrical Association for Women. It is, I believe, the first organization of its kind in the world and in its three years of existence has attracted a membership of two thousand, divided among eight branches. Under the directorship of Miss Caroline Haslett, it has done excellent work. Its new president is Mrs. Wilfrid Ashley, the wife of the Minister of Transport.

An educative force which functions within the electrical industry and which has already achieved remarkable success is the E.L.M.A. Lighting Service Bureau in London, which recently gave the seventeenth of its special illumination design courses. These are open to any member of the industry, and the lectures and demonstrations are held in premises completely equipped with experimental apparatus and a full range of modern lighting equipment.

---

# Rebuilding San Francisquito Power House

ONE of the two 17,500-kva. generators which were running when the St. Francis Dam in the San Francisquito Canyon, California, gave way on March 12 was damaged beyond repair. The other will be placed in operation after thorough cleaning and drying and reconstruction of the power house. Operations to this end are now in full blast, and the city of Los Angeles, owner of the plant, expects to have the unit in operation in June. A new unit has been ordered and will, it is expected, go into service by November. Enforced idleness of the plant is reported to be costing the city $2,000 a day.

## President-Elect Arkwright on Power Investigation

*He Calls for Constructive Criticism Based on Facts Concerning the Conduct of the Electrical Industry and on the Dissipation of Prejudice.*

IN A PRESS interview at Atlantic City just after the adjournment of the National Electric Light Association convention, the president-elect, Preston S. Arkwright, talked of the investigation into the light and power industry now in progress under the direction of the Federal Trade Commission.

"We welcome an opportunity to get the facts about the conduct of our business before the public," Mr. Arkwright said. "We shall be grateful if the Federal Trade Commission permits to be brought out the facts showing what we have done, what we are doing and what we hope to do.

"Our industry has felt for many years that a continuation of its success in expanding its service to wider and wider areas, from city to town, to hamlet, to farm, and in improving its service to existing customers and in making more economical its cost, depends upon public understanding of the industry. Prejudice is born of ignorance and will disappear when the facts and economic principles governing the industry are understood. A knowledge of the truth by the people will confuse the demagogues. If the industry is unjustly burdened, if it is subjected to repressive or unduly restrictive regulation, if it is constantly menaced with confiscation through government competition with limitless power of taxation to support uneconomic operation, it will of necessity be unable to perform this duty. The service will grow poorer, the territory of its usefulness will be narrowed, further beneficial applications of the service curtailed, its costs will grow higher, and while the industry will suffer loss, of course, the injury to the public in lessened helpfulness and in greater cost will be immeasurable.

"Knowing the facts and the detrimental consequences to the public of acts which result from a lack of understanding, the industry would fail in the trust reposed in it if it should neglect to employ every fair means to offset misrepresentations by knowledge. Constructive criticism would be helpful to it. Mere abuse or effort to create prejudice will accomplish harm alone. We trust that the criticism, if any is leveled at us, may be of a constructive character, capable of producing results that would be helpful."

## Canadian Convention Will Sail up the Saguenay

Sailing from Montreal on Wednesday morning, June 20, the steamship *St. Lawrence* will be the theater of the 1928 convention of the Canadian Electrical Association, which is affiliated with the National Electric Light Association, functioning as a geographic division. A stop will be made on Thursday at Port Alfred, where a motor trip of inspection will be made. The delegates will visit Arvida, Chute á Caron, Riverbend, Ile Maligne and other places which are the sites of large hydro-electric installations and projects. On Friday afternoon the boat will reach Murray Bay, where the annual banquet will be held at the Manoir Richelieu. The tour will end when Montreal is again reached on Saturday afternoon.

Besides the usual committee reports, there will be a paper on "The Economics of Supervisory Control Systems" by R. J. Wensley, Westinghouse company, and one on "High-Voltage Power Transmission" by H. H. Dewey, General Electric Company. Dancing on the boat and sports on land will provide amusement.

## Oregon Municipal-Plant Case Arouses Interest

In recognition of the national importance attached to litigation involving the jurisdiction of municipalities operating their own utilities outside of corporate limits, the Oregon Supreme Court has advanced on the docket for hearing the suit of the Yamhill Electric Company, respondent, vs. the City of McMinnville et al., appellants. This is a suit in equity brought by the private company to enjoin the city from constructing and operating a power line entirely outside and beyond the corporate limits and delivering energy over it to private consumers until the city shall have procured from the Public Service Commission a certificate of convenience and necessity. The lower court sustained the utility company and issued a restraining order. The city of Eugene, which also owns a municipal plant, has intervened, maintaining that to hold that all except corporate business belongs by law to private utility companies is to make the law discriminatory and hence unconstitutional.

When the Supreme Court renders its decision the authority of blanket-franchise privileges in Oregon will also be finally decided, one of the main points at issue affecting the jurisdiction of a county court in granting these franchises. The Yamhill company contends that the municipal utility is attempting to ignore such a franchise owned by its antagonist.

In the event of the decision affirming the findings of the lower court, it will be mandatory on the part of the regulatory commission to order that all municipalities owning and operating utilities outside of city limits comply with the law requiring public service corporations to file annual reports, adhere to the uniform accounting rules, remit gross income taxes and otherwise submit to regulation by the commission in matters of rates, charges and practices affecting those portions of lines and service beyond corporate boundaries. Another effect will be that a certificate of convenience and necessity will have to be obtained before any extension of a municipal plant outside city limits can be made.

## S.P.E.E. Meets at Chapel Hill on June 26-29

A four-day program has been arranged for the thirty-sixth annual meeting of the Society for the Promotion of Engineering Education, which will be held at the University of North Carolina, Chapel Hill, N. C., on June 26-29. President R. L. Sackett will preside at the opening session on Tuesday, when President H. W. Chase of the University of North Carolina will welcome the delegates. Herbert Schofield, principal of Loughborough College, England, will address this session on "A Productive Industrial Plant on College Premises," and there will be committee reports in the morning and teaching conferences in the afternoon. Other conferences will be held on subsequent afternoons.

On Wednesday R. I. Rees, American Telephone & Telegraph Company, will speak on "College Experience in Its Relation to Achievement in Industry"; Dr. C. F. Scott and W. E. Wickenden, director of investigations, will report for the board of investigation and coordination, and the annual dinner will be held in the evening. On Thursday Dean Sackett will make his official address, taking as his subject "The Changing Emphasis in Engineering Education,'" Governor A. M. McLean will speak, Prof. J. B. Davidson of Iowa State College will discuss agricultural engineering, and there will be a barbecue in the evening at the Cape Fear plant of the Carolina Power & Light Company. H. P. Hammond, associate director of investigations, will talk on "A Practical Step Toward Improving Methods of Teaching" on Friday morning.

## Dissatisfaction Expressed as to New St. Louis Rates

City Counselor Muench of St. Louis, in a statement filed with the Missouri Public Service Commission, contends that the Union Electric Light & Power Company should reduce its rates at least $1,418,000 instead of the voluntary cut of $706,467 provided in the schedules that became effective on June 1. The city authorities, for whom Mr. Muench speaks, ask that the commissioners make a complete investigation and audit of the Union Electric's books and records as well as an investigation of the operations of the company. They contend that a proper adjustment of the company's depreciation account would permit a total reduction of $2,000,000 in annual revenue and that even with so drastic a decrease the company could still earn 7 per cent return on its claimed valuation.

"The proposed rates offer no reduction to the small or domestic consumer in St. Louis, and in this respect, too, we believe that the schedule is unreasonable and unjust," Counselor Muench declares. He maintains that while the Union company claimed $1,698,164 for depreciation in 1926 and $2,336,400 in 1927, in reality it has never expended more than $429,616 over a period of eleven years for maintenance of its properties. The city contends that not more than $950,000 should be charged off for depreciation. In eleven years the company's depreciation reserve increased from $989,726 to $9,663,001 in 1927.

The Public Service Commission in an order issued on June 6 asked the Union company to answer or satisfy the city's demands for a general reduction in electric rates within ten days. The company will oppose the additional cut.

## Saranac Program for International Lighting Congress

After a tour of cities in the northeastern part of the United States and attendance at the Toronto convention of the Illuminating Engineering Society on Sept. 17 to 20, the delegates from foreign countries to the coming International Illumination Congress, together with American members, will, as previously announced, assemble at the Saranac Inn, Saranac Lake, N. Y., for their first world congress, to be held in connection with the plenary meeting of the International Commission on Illumination. The Saranac sessions will last from Sept. 22 to Sept. 28 inclusive, and a preliminary program has been drafted as follows:

A. Sessions under auspices of international technical committees: Automobile headlighting, C. H. Sharp, United States, chairman; daylight illumination, secretariat, Great Britain; factory and school lighting, L. B. Marks, United States, chairman; research on glare, secretariat, Italy; street lighting, W. Wissmann, Germany, chairman.

B. Open committee meetings, for discussion of other topics assigned to international technical committees; subjects to be announced later.

C. International symposia, arranged by program committee: Residence lighting practice, show-window lighting practice, lighting for aviation, status of lighting education.

D. Papers by leading authorities sponsored by national committees, including both scientific and practical subjects of outstanding interest in fields not covered by technical committees; subjects to be announced later.

The tour of inspection for the foreign visitors will begin at New York, where they are expected to meet about Sept. 5. Outstanding lighting installations and the important laboratories and manufacturing establishments devoted to illumination in the metropolitan area will be the first objectives. The visitors will then journey by special train to Philadelphia, Washington, Boston, Cleveland, Detroit, Chicago, Niagara Falls and Toronto. Opportunity will be extended to Americans desiring to accompany the foreign delegates on the tour. Reservations and plans are being handled by G. S. Merrill, chairman tour committee, Nela Park, Cleveland, Ohio.

# Briefer News

Increase of Generating Capacity at San Benito.—The power plant of the Central Power & Light Company at San Benito, Tex., is to be enlarged by the installation of a 10,000-kw. turbogenerator. The unit will almost double the capacity of the plant, which is now approximately 13,000 kw.

New York Electrical Society Elects Officers.—The annual meeting of the New York Electrical Society for the election of officers was held on Tuesday, June 12, when the following were elected: President, E. E. Dorting, Interborough Rapid Transit Company; vice-presidents, A. K. Baylor, E. B. Meginniss and H. H. Sheldon; treasurer, E. B. Meginniss (re-elected); secretary, H. E. Farrer, (re-elected). R. B. Grove, H. Rentschler and W. T. Teague remain as vice-presidents for one year.

Northern Maryland Power Company Was Sold for $821,275.—The purchase price of the property of the Northern Maryland Power Company in Havre de Grace, Aberdeen and vicinity, recently bought from the Philadelphia Electric Company by the Consolidated Gas, Electric Light & Power Company of Baltimore, has been revealed as $821,275 in the petition filed with the Maryland Public Service Commission seeking approval of the transaction. The commission set June 26 as the date for hearing.

Steam Plant to Aid Hydro Stations in British Columbia.—A contract has been let by the British Columbia Electric Railway Company for the construction of a steam plant for the generation of electrical energy on Burrard Inlet. It will cost $2,500,000 and will serve as an emergency source of supply in case of interruption of service from any of the hydro-electric plants normally used. It will be the first unit of what is to be known as the Hastings plant of the company.

Kentucky Utilities Company's New Construction Program.—A new program of construction and expansion has been developed by the Kentucky Utilities Company since May 1 which when completed will have entailed an outlay of about $150,000. It includes an outdoor high-tension switching station at Pocket, Va., and the building of new transmission and distribution lines in various parts of the company's territory, as well as the installation of additional apparatus.

Plans for Electragists' Convention.—Arrangements for the 1928 convention of the Association of Electragists International, at the Stevens Hotel in Chicago, Aug. 6 to 10, are going forward rapidly. The preliminary program includes addresses by Philip Cabot, School of Business Administration, Harvard; E. O. Shreve, General Electric Company; L. K. Comstock, National Councilor United States Chamber of Commerce; John F. Gilchrist, vice-president Commonwealth Edison Company; Victor Tousley, National Fire Protection Association, and others with pertinent messages for the members.

"White Ways" for Rural Roads.—First-hand information on what highway lighting of the future may be was imparted to one hundred county supervisors, city and town officials and engineers recently at an inspection of 7.3 miles of rural highway "white way" installed as a demonstration unit by the Rochester Gas & Electric Corporation. The "white way" link connects East Bloomfield and Canandaigua, N. Y.

Lower Rates in North Dakota.—The North Dakota State Railroad Board has approved new combination electric rates filed by the Montana-Dakota Power Company and applicable to homes where electricity is used for lighting, refrigeration and cooking; also new rates for commercial refrigeration and cooking purposes applicable to hotels and restaurants. The former will affect 46 North Dakota towns served by the company and the latter 39 towns.

Repairing Flood Damage at St. Johnsbury, Vt.—The Twin State Gas & Electric Company is rebuilding the power plant above St. Johnsbury Center, Vt., which was destroyed in the November flood. An automatically operated station of 200 kw. rating, the first of its kind in the section, will be built. Another automatic station is planned on the Passumpsic River above Arlington Bridge, and the St. Johnsbury dam which went out with flood will be rebuilt. Construction cost is estimated at $150,000.

Two California Utilities Reduce Rates.—The Vallejo Electric Light & Power Company and the Coast Counties Gas & Electric Company have been authorized by the California Railroad Commission to place in effect reduced rates applicable to commercial and domestic lighting. In the case of the Vallejo company the new rate will save customers approximately $25,000 a year, and on the lines of the Coast Counties company about 15,000 customers will benefit from an annual reduction of $70,000.

New Power Contract Between Hartford Light and Power Railway Utilities.—The Hartford (Conn.) Electric Light Company has entered into contract with the Connecticut Company, a traction utility, whereby the latter will purchase additional power from the former. The Connecticut Company will maintain the Commerce Street power plant and the Hartford company will install new equipment. At the present time the Hartford Electric Light Company is furnishing 1,500 kw. to the traction concern. It will add $200,000 worth of equipment to bring the energy furnished up to 6,500 kw. The contract will become operative as soon as the new equipment is installed.

Rate Reductions in Eastern Idaho for Street Lighting. — The Oregon Public Service Commission has ordered reductions ranging from 5 per cent to 20 per cent in rates for incandescent street lighting in all municipalities in eastern Oregon served by the Idaho Power Company. The new schedule became effective June 1.

New York Edison Rate Case Adjourned Until Fall. — At another hearing held last week by Public Service Commissioner William R. Pooley on the five-year-old complaint filed by John F. Hylan as Mayor against the rates charged by the New York Edison Company the only witness was Henry Brady, who testified concerning values of the real estate owned by the company. The city's valuation was $9,042,000, the company's $11,168,000. The hearing was adjourned until Sept. 15.

Norwalk, Ohio, Seeks Ejectment of Power Company.—The Court of Appeals of Toledo has ordered the Ohio Electric Power Company of Oberlin, a Middle West Utilities subsidiary, to cease operations at Norwalk, Ohio, by Sept. 1. The company has been operating for two years in competition with the municipal power plant, and the city about a year ago sought to eject it on the ground that it had no franchise. The Norwalk municipal plant is rated at 2,000 kva. It is believed here that the Ohio Electric Power Company will appeal to the State Supreme Court.

South Carolina City Claims an Electrical Record.—The little city of Chester, S. C., with less than ten thousand population, is the most completely electrified city in America, if one takes into consideration the number of homes equipped with electric ranges, according to John Paul Lucas, vice-president of the Southern Public Utilities Company of Charlotte, N. C. Two out of three of the white customers of the Southern Public Utilities Company in Chester are using electric ranges in their homes. It is little more than ten years ago since the first one was sold there.

Nova Scotia's New Hydro Enterprise.—The projected newsprint industry on the Mersey River, Nova Scotia, reported a few weeks ago, will lead the provincial government to undertake three separate power developments, at Upper Lake Falls, Lower Lake Falls and Big Lake Falls. The Lower Great Brook Falls site will still be available, as well as further capacity at "the Guzzle," where the Liverpool plant is situated, these providing for further ultimate development of 6,200 hp. It is expected that the three developments first named will be ready to deliver power by Oct. 1, 1929. The initial 20,000-hp. undertaking calls for the delivery of 105,000,000 kw.-hr. annually. The capital cost is estimated at $3,659,000. The power will be supplied to the company at cost, put at approximately $20 a horsepower, for a period of 40 years.

Centralia, Wash., Plans Municipal Plant.—As a preliminary to embarking on a municipal power project entailing an estimated expenditure of $300,000, the Mayor and City Commissioners of Centralia, Wash., have filed water right application at Olympia to take 25 sec.-ft. from the Skookumchuck River in Thurston County. The plan would require construction of a 24-mile pipe line, which would provide power for the electric plant and give the city added water supply. At present the city gets its electric energy from the Western Cross Arm & Manufacturing Company, using its own distributing system. It is planned to begin work on the project by Sept. 1.

## *Coming Meetings*

**[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]**

Northwest Division, N.E.L.A.—Portland, Ore., June 19-22. B. Snow, 1208 Spalding Bldg., Portland, Ore.

American Society of Agricultural Engineers—Rural electric session, Hamilton Hotel, Washington, June 19-22. Raymond Olney, St. Joseph, Mich.

Canadian Electrical Association—SS. "Richelieu" from Montreal to Saguenay and return, June 20-23. H. M. Lyster, 712 Power Bldg., Montreal.

American Institute of Electrical Engineers—Cosmopolitan Hotel, Denver, June 25-29; Pacific Coast convention, Spokane, Wash., Aug. 28-31. F. L. Hutchinson, 33 West 39th St., New York.

Association of Iron and Steel Electrical Engineers—Hotel Stevens, Chicago, June 25-28. J. F. Kelly, Empire Bldg., Pittsburgh.

American Society for Testing Materials — Chalfonte-Haddon Hall, Atlantic City, N. J., June 25-29. C. L. Warwick, 1315 Spruce Street, Philadelphia.

Society for the Promotion of Engineering Education—University of North Carolina, Chapel Hill, N. C., June 26-29. F. L. Bishop, University of Pittsburgh, Pittsburgh.

Empire State Gas and Electric Association—Commercial Section, Hotel Utica, Utica, N. Y., June 28 and 29. C. H. B. Chapin, Grand Central Terminal, New York.

Public Utilities Advertising Association—Detroit, July 8-12. T. P. Pfeiffer, Byllesby Engineering & Management Corp., Chicago.

East Central Division, N.E.L.A.—Cedar Point, Ohio, July 10-13. D. L. Gaskill, Greenville, Ohio.

National Electric Credit Association—Boston, July 16 and 17. F. P. Vose, 1008 Marquette Bldg., Chicago.

Wisconsin Utilities Association, Electric Section—Appleton, Wis., July 26 and 27. J. N. Cadby, 432 Broadway, Milwaukee.

National Electrical Manufacturers' Association — Policies Division, Association Island, Henderson Harbor, N. Y., July 29-Aug. 1. S. N. Clarkson, 420 Lexington Avenue, New York.

Camp Co-operation VIII—Association Island, Henderson Harbor, N. Y., Aug. 2-7. Society for Electrical Development, 420 Lexington Avenue, New York.

Association of Electragists International—Hotel Stevens, Chicago, Aug. 6-11. L. W. Davis, 15 West 37th St., New York.

Albert Lea, Minn., and Osage, Iowa, to Be Joined by 60,000-Volt Line.—The Central States Power & Light Company, with headquarters at Dubuque, Iowa, expects soon to begin the construction of a transmission line between Osage, Iowa, and Albert Lea, Minn., a distance of about 50 miles. It will cost $3,500 a mile and will carry a maximum load of 66,000 volts.

National Commissioners' Association Will Meet at New Orleans in November.—The place first selected for holding the 1928 convention of the National Association of Railroad and Utilities Commissioners has, as the result of a referendum, been changed from Glacier National Park, Mont., to New Orleans. The opening date of the convention has also been changed from Sept. 10 to Nov. 13. The reason for the change was the desire to wait until the presidential election was over and the fact that the climate of the Montana resort would be inclement at the later date.

Rocky Mount (N. C.) Municipal Plant Found Inadequate. — Rocky Mount, N. C., which finds its municipal electric plant inadequate, has engaged an electrical engineer to make a survey of the situation and transmit recommendations to the Board of Aldermen. Three solutions have been suggested—the addition of another unit to the power plant, connection with the Rocky Mount mills, which generate their own power, and interconnection with the privately owned transmission line already built. Aldermen desired to add a unit to the present plant at a cost of $90,000, but strong opposition has arisen.

Wisconsin Accountants Will Meet.—The Accounting Section convention of the Wisconsin Utilities Association, to be held in Milwaukee, June 21-22, promises some interesting discussion. A certified public accountant will give his professional view of public ownership, the chairman of the Wisconsin Railroad Commission will discuss state versus national control and regulation of utilities, and the auditor of the Wisconsin Power & Light Company, which is a leader in rural electrification, will talk on cost accounting as involved in the operation and maintenance of farm-line extensions.

Underground Transmission Agitated for Cincinnati Subdivisions.—Members of Cincinnati's city planning commission, in session June 4, were told by the Union Gas & Electric Company that underground installation of all service wires in subdivisions of the city, as proposed in a special order pending before the commission, would cost five times as much as overhead construction. As this would be the opening of a campaign to extend this method throughout the city, it would result in doubling the present cost of service. The company expressed willingness to proceed with the improvement in a gradual manner.

ITINERARY OF THE 1928 INTERNATIONAL "POWER TOUR."—The Midwest Power Conference announces the following program for the "power tour" to Europe arranged by it: Aug. 18, sail from New York; Aug. 26-28, Glasgow; Aug. 29, Newcastle; Aug. 30, Manchester; Aug. 31, Rugby; Sept. 1-4, London; Sept. 5-6, Cologne; Sept. 7-9, Berlin; Sept. 10-11, Leipzig; Sept. 12, Zurich; Sept. 13, Zurich and Baden; Sept. 14-15, Milan; Sept. 16-17, Milan or Turin; Sept. 18-21, Paris; Sept. 22, sail for New York. The New York City offices of the Midwest Power Conference, 25 Broadway, may be addressed for reservations.

UTAH COPPER COMPANY TO EXTEND ELECTRIFICATION.—Complete electrification of the Bingham (Utah) mining properties of the Utah Copper Company, involving a minimum of 20 electric locomotives and a maximum of approximately 40, has been announced by that company. Although the actual mining operations are already electrified, utilizing electric shovels, the haulage system of the property has up to the present been of the steam type. When completed, the project will, it is said, be the largest electrified metal mine in the world and will involve the largest number of electric locomotives ever applied to an open-cut mining operation. The decision to change over from steam to electric haulage, electrifying the entire project, follows a test of about a year with a trial installation of a 75-ton combination storage battery, trolley and cable-reel locomotive built by the General Electric Company.

IRON AND STEEL ELECTRICAL ENGINEERS TO GO TO CHICAGO.—In connection with its annual exposition the Association of Iron and Steel Electrical Engineers will hold technical sessions at the Hotel Stevens, Chicago, on June 25 to 28, when reports and papers will be presented on electric heat, electrical developments, electric welding, standardization, high-tension practices, motor-driven rollers, selection of motors for main drives of strip and skelp mills, selection of motors for main drives of merchant, bar and rod mills, insulation of open-hearth checkers, boiler pressures above 350 lb., factors governing the purchase of coal, anti-friction bearings for roll necks, anti-friction bearings for motors and anti-friction bearings for auxiliaries. There will be a conference on fuel savings.

THE PROPOSED VALUATION OF THE PORTLAND (ORE.) COMPANIES.—Departing from the usual procedure, the Oregon Public Service Commission officially invited customers concerned to present to it on June 14 their views concerning the mode of action to be adopted in connection with the pending examination of the rates and valuation of the Portland Electric Power Company and the Northwestern Electric Company. The investigation involves the establishment of a rate schedule for residential lighting and cooking and commercial lighting in districts served by the two utilities outside of the metropolis only. The commission desires to be guided as to whether it shall undertake to establish entirely new valuations or shall use the valuations found as of Dec. 13, 1916, based on 1914 prices, and, if the latter, whether the valuation of 1916 shall be treated merely as evidence of the extent and value of the property at that time.

# Commission Rulings

DISTRIBUTING COMPANY MAY INCLUDE IN RATE BASE THE VALUE OF LINE ADVANTAGEOUSLY LEASED BY IT.—Dismissing a complaint of alleged excessive rates brought against the La Jara Electric Company, the Colorado Public Utilities Commission discussed an objection raised to the inclusion in the rate base of the value of a transmission line owned by the company but leased by it to the Colorado Power Company, from which the La Jara company purchased energy for distribution. The commission pointed out that the arrangement was a financially advantageous one and said: "If the defendant had not entered into this contract, it could hardly be contended that the value of the line should not be included in its entirety in the rate base. It is, therefore, difficult to conclude that after the defendant has entered into a contract saving the consumers $587 per year the value of the said line should in large part be eliminated from the rate base."

GROWTH OF BUSINESS WITH REDUCED RATES WILL OFFSET PART OF APPARENT LOSS.—The fact that in a prosperous community the natural growth of business will be accelerated by the reduction of rates was dwelt upon by the Massachusetts Department of Public Utilities in its order, previously reported in the ELECTRICAL WORLD, reducing the maximum price of the Cambridge Electric Light Company from 8 to 5½ cents a kilowatt-hour. The department said: "On the basis of the consumption in 1926 this would mean a reduction on all electricity sold for domestic and commercial purposes of a maximum of $318,805 and, in our opinion, would be considerably less. Such a reduction would leave as a net amount available for dividends, after setting aside the same depreciation as in 1926, the sum of at least $345,000. It is clear, however, that the actual reduction would be less than the amount above stated. Experience has demonstrated that a reduction of rates charged for electricity will effect a substantially increased use for domestic and commercial purposes, resulting in increased gross income without corresponding increases in expense. In addition, the reduction in income will result in decreased taxes. Both of these factors will operate to make an actual reduction in income considerably less than the maximum amount stated."

# Recent Court Decisions

INDIANA ACT ALLOWING APPEAL TO COURTS FROM COMMISSION DECISIONS DECLARED UNCONSTITUTIONAL.—A ruling affecting public utility patrons of Indiana and utilities themselves, made in the Circuit Court at Frankfort, has declared unconstitutional the 1927 statute permitting individuals, corporations and municipalities adversely affected by orders of the Indiana Public Service Commission to appeal to circuit and superior courts. The ruling was in an appeal taken by telephone patrons at Kirklin, Ind., from a commission order granting rate increases to the company in that town. The court held the statute unconstitutional on the ground that the law delegated a duty to the court which it was not empowered to fulfill. The statute was one of the so-called remedial measures passed by the last Legislature. Harvey Harmon, a member of the Public Service Commission, had declared it to be a disastrous piece of legislation which virtually vitiated the commission's powers of regulation.

COMMISSION DECISION ON VALUATION PRESUMPTIVELY CORRECT.—In the decision of the United States District Court in Massachusetts vacating the restraining order granted to enjoin the Department of Public Utilities from enforcing its rate decision in the case of the Cambridge Electric Light Company (ELECTRICAL WORLD, April 14, page 776) the chief argument for upholding the decision pending the report of a special master was phrased as follows: "The parties are in disagreement as to the value of the property, the legal rate of return and the amount of net return which the new rate will produce. Upon the first point we are asked to accept for present purposes the valuation of the company's expert and officers against that of the department made after hearing the same expert and presumably the same officers. This ought not to be done unless we are satisfied that the department valuation, which carries a presumption of correctness, is based upon some fundamental error of fact or of law. The plaintiff contends that the department has proceeded upon the Massachusetts theory of valuation in disregard of the principles established by the United States Supreme Court. In the case of the Worcester Electric Light Company the court evidently so viewed the findings of the department, and the injunction was granted. In the present case, which was decided by the department after the Worcester case had been decided by the court, the department explicitly states that its valuation has been arrived at under the rules of the United States Supreme Court. There is nothing in the record which warrants us in ignoring or disregarding this statement. The value found is a fact, in determining which the department declined to accept the evidence of value now submitted to us by the plaintiff. We are not dealing with the case on full proofs, but only in a preliminary way and on the evidence as it stands. No sufficient reason is shown for rejecting the decision of the department, which is presumptively correct, in favor of affidavits submitted by the plaintiff, largely from the same witnesses whose testimony *in extenso* was regarded as unconvincing by the commissioners."

# News About Men of the Industry

## *P. S. Arkwright New President of N.E.L.A.*

Preston S. Arkwright, who was elected president of the National Electric Light Association at the convention held last week in Atlantic City, has been nationally prominent in electrical circles for a number of years. Following graduation from the University of Georgia law school in 1891 with the degree of LL.B., Mr. Arkwright practiced law in Atlanta for about a decade before entering the public utility field. To the electrical industry he brought brilliant legal attainments, coupled with sound executive ability, which enabled him to build up a consolidated system in Atlanta out of a troubled and disorganized situation. This achievement, perhaps more than any of his other accomplishments, attracted the attention of the light and power executives throughout the country and it was not long before he was recognized as one of the industry's energetic leaders, famous for his ability to establish good public relations.

*P. S. Arkwright*

When Mr. Arkwright became president of the Georgia Railway & Power Company, successor to the Georgia Railway & Electric Company, in 1912, hydro-electric power development was practically unknown in the South. During his presidency the company has acquired the Bull Sluice development and harnessed the waters of the Tallulah and Tugalo Rivers, one of the biggest hydro-electric projects undertaken in the southern part of the country. Mr. Arkwright has been chairman of the civic development committee of the N.E.L.A. during the past year and by virtue of his election to the presidency becomes chairman of the Charles A. Coffin prize committee.

---

Roy A. Hunt has been elected president of the Aluminum Company of America to succeed Arthur V. Davis, who has been made chairman of the board. Mr. Hunt has been a vice-president and director. Edward K. Davis has resigned as a vice-president and director of the company and has been elected president of Aluminum, Ltd.

Samuel Insull, Jr., arrived in New York aboard the Cunard liner *Mauretania* June 8 after a short sojourn abroad.

Edward N. Hurley, chairman of the executive committee of the Electric Household Utilities Corporation, returned from abroad June 11 on the *Leviathan* of the United States Lines after a sojourn in Europe.

Frederick A. Scheffler, special representative of the Fuller Lehigh Company, New York, is at the present time touring Europe. His itinerary includes Lisbon, Naples, Rome, Florence, Venice, Paris and London. Mr. Scheffler will return to New York about July 10.

C. A. Kittredge, who has been connected with the distribution department of the Alabama Power Company, has been transferred to Gadsden in the capacity of district manager. Mr. Kittredge was formerly identified with the company's southern division for several years as superintendent.

John W. Sheehey, for the past ten years superintendent of distribution of the Burlington (Vt.) Light & Power Company, has been appointed manager of the company on behalf of the Peoples Light & Power Company, which lately acquired it from the United Gas Improvement Company. He succeeds D. W. Jardine, who has been transferred to the Philadelphia offices of the U.G.I. organization.

O. J. Miller, for the past five years superintendent of production for the Tennessee Electric Power Company, has been appointed manager of the production and transmission departments of the company, in which capacity he will be responsible for the operation of all of the company's power stations and the construction and operation of the transmission lines throughout the territory served by the company in middle and east Tennessee. A native of Ohio and a graduate of Ohio State University, Mr. Miller first entered the employ of E. W. Clark & Company Management Corporation at Columbus, Ohio, working on various civil and mechanical matters in connection with the operation of public utility properties. In 1920 he removed to Chattanooga with the Tennessee Power Company on various problems of operation and construction and in 1923 he was appointed superintendent of the production department of the company, in which capacity he had active charge of power generating equipment at all of the company's plants.

## *H. B. Crouse Elected President of N.E.M.A.*

Huntington B. Crouse, president of the Crouse-Hinds Company, Solvay, N. Y., was elected president of the National Electrical Manufacturers' Association at the convention held during the past week in Hot Springs, Va. For many years Mr. Crouse has held a position of prominence in the electrical industry not only as a manufacturer of a product of unusual quality but also as a counselor to the industry and its representative associations.

A native of Fayetteville, N. Y., Mr. Crouse became identified with the electrical business immediately following graduation from Andover. He entered the organization already established by his father for the manufacture of panels and switches, the business which later became the Crouse-Hinds Company. Advancing consistently, he came into control in 1905. During his tenure of office the organization attained an enviable position and reputation in the industry and he himself a position of acknowledged leadership.

*H. B. Crouse*

In spite of the time and energy which Mr. Crouse devoted to the upbuilding of the Crouse-Hinds Company he has shown a marked interest in the representative associations of the industry. At the present time he is a member of the board of governors of the N.E.M.A. and of its executive and policy committee, in addition to being chairman of the finance committee and a member of the business policies committee and the labor committee. He is a past-president of the Associated Manufacturers of Electrical Supplies and has been a stanch supporter of the National Electrical Code.

---

R. J. Russell, vice-president and a director of the Century Electric Company, has been elected president of the St. Louis Electrical Board of Trade. Mr. Russell is a prominent figure in electrical manufacturing circles, being also a member of the board of the National Electrical Manufacturers' Association.

## *F. G. Hamilton Receives New Appointment*

Fred G. Hamilton has been appointed manager of operations for the Southern California Edison Company. Mr. Hamilton has had 30 years of service with the Edison company and its predecessor organizations. Beginning in 1899 as a lineman for the Mount Whitney Power Company in Visalia, he has continuously advanced through the various ranks until at the time of the consolidatión of the Mount Whitney and Edison companies, in 1917, he was made division superintendent of the San Joaquin Valley district. In 1924 he was transferred to the general office of the Edison Company of Los Angeles as general superintendent of distribution, which put him in charge of all distribution and transmission systems and substation operation. In 1925 he was made assistant manager of operations, which position he held until his recent appointment as head of the operating department.

Prof. A. G. Christie of Johns Hopkins University sailed for England on the *Mauretania* June 13 to be engaged in consulting engineering work during the summer with some British interests.

N. B. Hinson, who since 1922 has been system-planning engineer for the Southern California Edison Company, has been appointed assistant manager of operation. Mr. Hinson has had 22 years of electrical experience, all of which has been with the Southern California Edison Company, having entered the employ of that company immediately after leaving school in 1906. He spent the first few years in the test department of the company in various capacities. In 1912 he was transferred to the general office as assistant distribution engineer. In 1914 he was appointed distribution engineer and in 1919 he was promoted to be assistant superintendent of distribution. In 1922 he became system planning engineer, in which capacity he determined the needs for service and decided upon locations of substations, transmission lines and general system layouts.

Edward B. Meyer, chief engineer of the Public Service Production Company, Newark, N. J., was the guest of honor at a testimonial dinner given May 31 in commemoration of his quarter century connection with Public Service companies. The dinner was given at the Washington Restaurant, Newark, with about sixty friends and associates in attendance. A silver platter, a loving cup and a scroll containing the signatures of those present were presented to Mr. Meyer. Having joined the Public Service Corporation of New Jersey, successor to the United Electric Company, in 1903 as engineering assistant, Mr. Meyer has passed successively through all of the engineering branches of the central-station industry and is today a recognized authority on central-station practice. He is widely known in the engineering world for the contributions he has made to the literature on electric transmission and distribution and he has always given generously of his time to the activities of the various engineering societies, being a member of the American Institute of Electrical Engineers, the American Electric Railway Association, the American Society of Mechanical Engineers and in addition he has served on several committees of the National Electric Light Association.

## *W. H. Burke New President of Southwestern Association*

Walter H. Burke, who was elected president of the Southwestern Public Service Association at the recent convention in Dallas, as announced in the May 12 issue of the Electrical World, has been Southwestern district manager of Stone & Webster, Inc., for the past year. Mr. Burke has been identified with Stone & Webster for some years and has had engineering experience with that organization in various sections of the country. He was graduated from the University of Maine in 1906 and after a short connection with the General Electric Company he entered the public utility field. He spent one year in the Boston office of Stone & Webster and then removed to Dallas, Tex., these properties being under the executive management of Stone & Webster. He relinquished his duties as assistant to the manager of the Dallas utility to join the Milwaukee Electric Railway & Light Company. Rejoining the Stone & Webster organization, he served as manager of the Houghton County Electric Light Company and the Houghton County Traction Company, Houghton, Mich., and in the same capacity with the Keokuk (Iowa) Electric Company. He was manager of the Northern Texas Traction Company and the Tarrant County Traction Company before assuming the managership in the Southwest, comprising the plants in Texas, Louisiana, New Mexico and Mexico, with headquarters in Houston, Tex.

*W. H. Burke*

C. Harold Berry, for nearly three years associate editor of *Power*, a McGraw-Hill publication, has been appointed professor of mechanical engineering in the engineering school of Harvard University, to succeed Dr. Harvey N. Davis, who was recently elected to the presidency of Stevens Institute. The appointment is effective Sept. 1, 1928. Prior to his connection with *Power*, Mr. Berry was with the Detroit Edison Company as technical engineer of power plants, responsible for testing and operating economy in the four steam generating stations of that company. He has been active in the American Society of Mechanical Engineers as a member of the power tests code committee and of the subcommittee on steam turbines.

Louis Larsen, formerly connected with the Sundh Electric Company, Newark, N. J., is now vice-president and secretary of the Wagner Engineering Company, Inc., contracting engineers of New York. Mr. Larsen's resignation as general manager of the Sundh Electric Company followed a period of service which covered 26 years. He started with the organization when it was formed by Mr. Sundh and before becoming general manager he served as works manager and chief engineer. During his connection with the company he was granted many patents on control equipment and in addition he represented the company as executive member in the old Electric Power Club and later in the National Electrical Manufacturers' Association.

## Obituary

John W. Robb of Clinton, Ind., one of the organizers of the Clinton Electric Company in 1890 and past-president of the Indiana Electric Light Association, recently died. Mr. Robb had been identified with the business, church and philanthropic life of his home city for many years. A native of Highland County, Ohio, he entered the mercantile business in Bainbridge, O. Subsequently he took an active part in the affairs of the Wabash Valley Electric Company, which absorbed the Clinton Electric Company some years ago.

John B. Thomas, who had been identified with the Westinghouse company for the past 52 years, died recently at his home in Pittsburgh, Pa. At the time of his death Mr. Thomas was assigned to special duty with the company. Mr. Thomas entered the employ of the Westinghouse company in 1876 and had been with Westinghouse companies since that date. In 1886 he was sent by George Westinghouse to Paris to manage the French branch of the air-brake company. He returned in 1888 and was transferred to the Westinghouse Electric & Manufacturing Company, with which organization he remained until his death.

# Financial and Statistical News

## *Stocks Recover Sharply*
## *Earnings Up 7 Per Cent*

THE extent to which the drastic selling movement in the security markets early this week affected the power and light stocks is seen in an eleven-point drop in the ELECTRICAL WORLD index of common stocks. This index opened the year at 122, rose fairly steadily to 157 on May 19, and then receded to 142, a fifteen-point drop from the year's high. Its position over a longer period is seen by a comparison with this week last year, when it stood at 108, and the same week two years ago, when it stood at 90. The power and light stocks, however, were among the first to recover after the selling wave subsided.

Power and light company annual reports for 1927 continue to show an increase in gross revenue of about 7 per cent, on the average, over 1926. This is regarded as a normal increase and, as normally, the utilities continue to show a decided stability in earnings in the face of a revenue decline in the case of many of the large transportation systems and industrial companies.

Power and light company bond prices have been well maintained without much change from recent levels. There is evidence in the bond market in general of some fluctuation in quotations from recent peaks and fractionally lower prices are recorded in several issues.

## New Italian Loan Floated

The Piedmont Hydro-Electric Company (Società Idroelettricà Piemonte) made an offering of first mortgage gold notes to the amount of $4,000,000, the price being 99¾ and interest, to yield about 5¾ per cent. These one-year 5½ per cent notes were dated June 15, 1928, and mature June 15, 1929. Proceeds will be applied to the acquisition and construction of generating plants, substations and transmission and distribution lines, or to the reduction of debt incurred for these purposes, and for other corporate purposes.

## Date Set for Indiana Merger

A compromise basis for exchange of securities, announced by Halsey, Stuart & Company, of Chicago, indicates that the proposed merger of the Terre Haute, Indianapolis & Eastern Traction Company and the Central Indiana Power Company, under the title of the Indiana Electric Corporation, either is to be declared operative or entirely abandoned soon after July 1. It is believed that the exchange plan will be acceptable because it was proposed by committees of affected bondholders and stockholders and that the merger will be consummated. The proposal follows:

That holders of the first mortgage bonds of three companies—Indianapolis & Northwestern Traction Company, Indianapolis & Martinsville Rapid Transit Company and Indianapolis, Crawfordsville & Danville Electric Railway Company—are to receive one share of Indiana Electric Corporation preferred stock, series A, for each $100 principal amount of bonds.

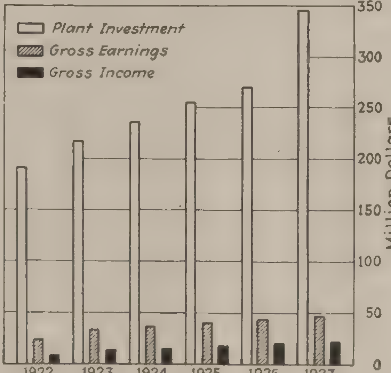
That holders of the 5 per cent cumulative preferred stock of two companies—Indianapolis & Northwestern Traction Company and Indianapolis, Crawfordsville & Danville Electric Railway Company—are to receive Indiana Electric Corporation preferred stock, series B, on a par for par basis.

## German Company Offers Debentures

Gesellschaft für elektrische Unternehmungen (Corporation for Electrical Enterprises), or Gesfürel, issued during the past week 6 per cent sinking fund gold debentures (with stock purchase warrants) to the amount of $5,000,000 at 100 and interest, yielding 6 per cent. The organization, formed in 1894, is one of the leading factors in the development of the electric light and power industry in Germany and in Europe generally.

# American Water Works & Electric Builds More Economical Structure

AN INCREASE of 11 per cent in the operating costs of the American Water Works & Electric Company held the rise in gross income to slightly over 4 per cent, although gross earnings increased approximately 8 per cent.



*Six years development of American Water Works*

The operating ratio rose slightly from 51 per cent in 1926 to 53 per cent last year.

Serving sections of Pennsylvania, Maryland, Virginia, West Virginia and Ohio through a group of subsidiaries operating electric, gas and transportation properties, this holding company has gradually added new units and consolidated them into its system. The group has property, plant and investments valued at approximately $346,500,000 and, with earnings of $48,727,401, showed a property investment of slightly over $7 per dollar of gross earnings last year.

The capital structure of the American Water Works & Electric Company was revamped last year. The entire issue of 7 per cent preferred stock of the old company was called for payment or exchangeable into a 6 per cent preferred stock of the new company. Common stock of the old company was exchanged for common of the new on the basis of two new shares for one old. Per share earnings on the old $20 par common stock were $5.47 in 1926. Last year there was a balance for dividends and surplus of $4,860,146. Preferred dividends would require $1,200,000, leaving $3,660,146 for 1,361,413 shares of no-par common stock, or about $2.70 a share. The stock is currently selling around $56, or about twenty times earnings.

American Water Works & Electric common stock incidentally has proved more than ordinarily remunerative to holders over a period. The average price in 1923 was about 36. In 1924 there was a five-for-one split from $100 to $20 par. This, along with last year's two-for-one split, brings the current value of the new stock to around $630. This growth compares very favorably with that of any comparable company.

The purpose of the recapitalization plan was to produce a more economical means of providing new capital for the rapid growth and profitable extension of the company's business. The change to a Delaware charter allowed the issuance of preferred stock bearing a lower dividend rate than was possible under the old company. There was also a saving in the annual tax bill, and since the stock of a Delaware corporation is not subject to the Delaware inheritance tax when held by non-residents of Delaware it would be of importance to the vast majority of common stockholders, who were subject to the Virginia inheritance tax.

## Buffalo, Niagara & Eastern Sells Stock Issue

In connection with its large-scale simplification and consolidation program the Buffalo, Niagara & Eastern Power Corporation will now issue 350,000 shares of 5 per cent cumulative first preferred stock at a price of 95½ and accrued dividend. Around 290,000 shares were placed through exchange for preferred stocks of subsidiaries and the balance is being offered subject to prior sale. In other words, the issue is entirely for refunding purposes and is an important step in the simplifying of the new capital structure. After completion of the present financing the capitalization of the parent company will comprise two preferred issues, two common issues and a small amount of scrip, and the stocks of the corporation junior to the first preferred stock, which is the present issue, have a market value, based on current quotations, in excess of $150,000,000.

CENTRAL STATES ELECTRIC DECLARES INITIAL STOCK DIVIDEND.—An initial quarterly stock dividend of 2½ per cent (1/40 of a share) in common stock, together with the regular cash quarterly dividend of 25 cents per share, was declared on the common stock of the Central States Electric Corporation at a meeting of the board of directors held June 5, payable July 2 to stockholders of record June 11. It is expected that this 2½ per cent quarterly stock dividend marks the inauguration of regular dividends at the annual rate of 10 per cent in common stock and $1 in cash. The directors also declared a regular quarterly dividend of $1.75 per share on the 7 per cent preferred stock, payable June 30 to stockholders of record June 9, and $1.50 per share on the 6 per cent cumulative preferred stock, payable July 2 to stockholders of record June 11.

RECENT LISTINGS.—The New York Stock Exchange has authorized the listing of 49,310 shares of $6 preferred stock of the American & Foreign Power Company, Inc., without par value, on official notice of issuance, in exchange for securities of the Mexican Utilities Company. Recently there has also been authorized for listing (a) 38,736 additional shares of common stock of the American Power & Light Company on official notice of issuance and distribution in payment of a stock dividend and 65,000 shares of common stock on official notice of issuance for a consideration of cash at the rate of not less than $83 per share, making the total amount of common stock applied for 2,085,758 shares; (b) 787,601 shares of preferred stock ($6 cumulative dividend) now outstanding in the hands of the public and 9,727 shares of preferred stock ($6 cumulative dividend) on official notice of issuance in exchange for common stock of the Washington Water Power Company, making the total amount of preferred stock applied for 797,328 shares. Preferred stock of the Standard Gas & Electric Company ($4 cumulative preferred) has been authorized for listing to the amount of 535,259 shares on official notice of issuance of temporary interchangeable $4 cumulative preferred stock certificates in exchange, share for share, for the 8 per cent cumulative preferred stock (par $50 per share) which at the present time is listed on the big board.

FURTHER EXPANSION ANNOUNCED FOR SHAWINIGAN COMPANY.—Stockholders of the Shawinigan Water & Power Company will be asked at a spe-

cial meeting called for June 26 to approve an increase in the authorized common stock from 1,600,000 to 2,600,000 shares, the additional 1,000,000 no par shares to be issued from time to time as deemed necessary by the directors. This represents the second increase which has been made in the capitalization this year, the former increase, which was from 1,200,000 to 1,600,000 shares, having been authorized at a special meeting of the shareholders held Feb. 21.

MAYTAG COMPANY PLACES COMMON STOCK ON ANNUAL DIVIDEND BASIS.—The directors of the Maytag Company have declared an initial quarterly dividend of 37½ cents per share on the new common stock of the Maytag Company, no par value, payable July 1 to holders of record June 15.

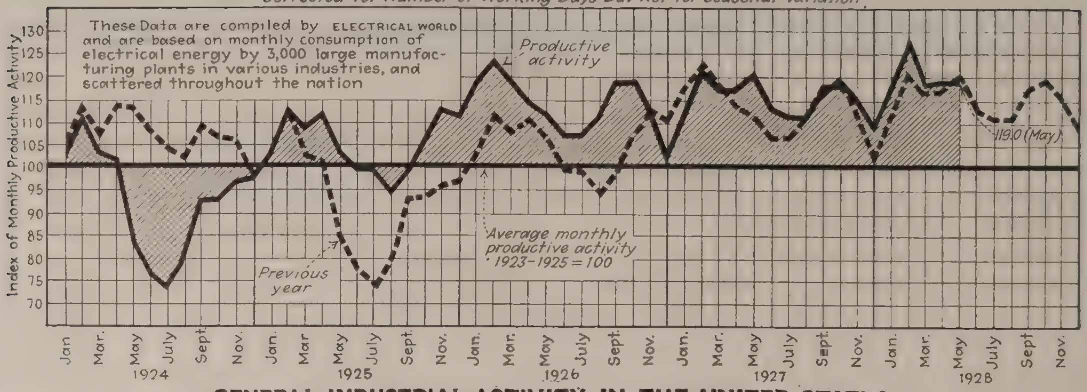
## Southeastern Power Plans Capital Increase

Directors of the Southeastern Power & Light Company have proposed increasing its capitalization from 7,000,000 shares to 8,000,000 shares through the creation of 1,000,000 shares of $5 dividend preferred stock. Shareholders will be asked to approve the proposal at the annual meeting on July 11.

The present capitalization of Southeastern comprises 750,000 shares of $7 preferred, 250,000 shares of $6 preferred, 1,000,000 shares of participating preferred and 5,000,000 shares of common, all of which have no par value. The new $5 preferred issue would rank *pari passu* with the $6 and $7 preferred stock. The company announces it has no plans for issuing the new preferred stock immediately, and that it will be created solely to provide a means for more economical future financing.

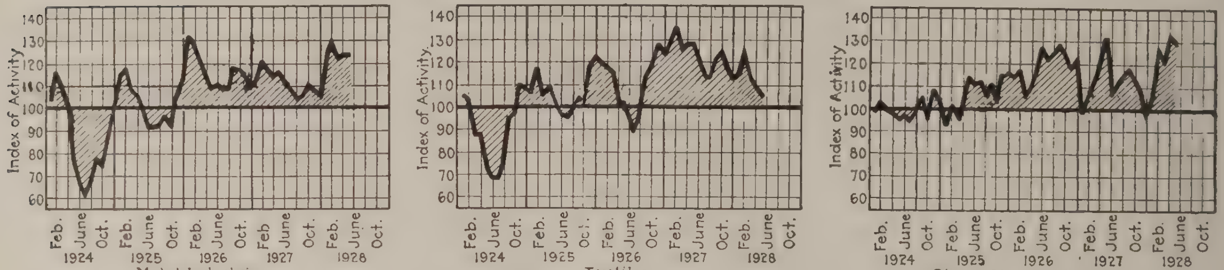
GENERAL PUBLIC SERVICE TO INCREASE PREFERRED STOCK.—The directors of the General Public Service Corporation have called a special meeting of stockholders for June 21 to vote on an increase in preferred stock from 75,000 to 175,000 shares as a preliminary to reconstruction of the capital base of the company. In a statement explaining the proposed increase, C. W. Kellogg, president, said the corporation had an exceptionally large equity base, more than 50 per cent of its asset value being represented by common stock and an additional 14 per cent being represented by convertible preferred stock which was junior to the preferred stock.

Corrected for Number of Working Days But Not for Seasonal Variation



These Data are compiled by ELECTRICAL WORLD and are based on monthly consumption of electrical energy by 3,000 large manufacturing plants in various industries, and scattered throughout the nation

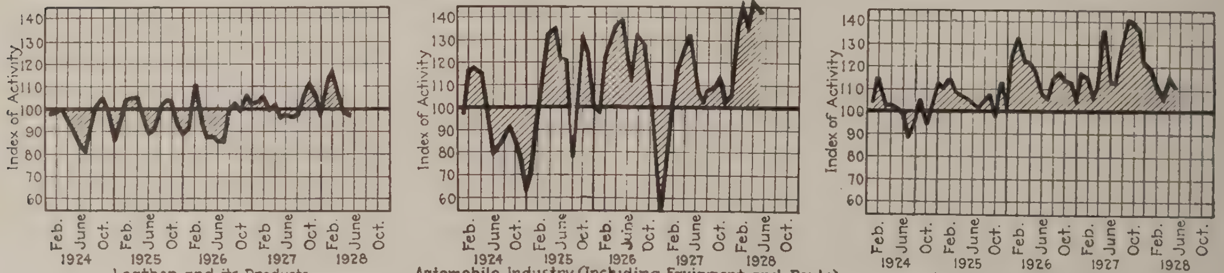
**GENERAL INDUSTRIAL ACTIVITY IN THE UNITED STATES**



Metal Industries

Textiles

Stone, Clay, and Glass



Leather and its Products

Automobile Industry (Including Equipment and Parts)

Lumber and its Products

**PRODUCTIVE ACTIVITY IN THE PRIMARY INDUSTRIES OF THE UNITED STATES**

# High Productive Operations Maintained During May

THAT the volume of general production during the first five months of the current year has been about 2.7 per cent above that during the same period in 1927 is indicated by reports on electrical energy consumption received by the ELECTRICAL WORLD from approximately 3,000 large manufacturing plants scattered throughout the nation and in various industries, plants consuming more than 15,000,000,000 kw.-hr. of electrical energy per annum. The basic figures indicate that eight of the primary industrial groups—rolling mills and steel plants, ferrous and nonferrous metal working plants, leather and its products, automobile, stone, clay and glass, rubber and its products, chemicals and allied products, and food and kindred products—turned out a volume of products during the period greater than in 1927, although in some of the groups the increased volume was only slight. On the other hand, four just as important industrial groups—textiles, lumber and its products, paper and pulp, and shipbuilding — were operating during these five months as a whole at a lower rate than in 1927.

The rate of industrial production during May was about 0.2 per cent under April and about 1.3 per cent under May of last year. This is the first time since last September that the index of industrial activity has been under that of the same month in the year previous. May was the peak month of industrial activity last year, while the indications seem to be that the peak of activities during the current year were reached in February.

The index of activity in general industry based on consumption of electrical energy stands at 119.0 for May, as compared with 119.3 for April. Comparative index of productive activity referred to the average activity for the period 1923-25 as 100 and adjusted for number of working days are as follows:

| | |
|---|---|
| May, 1928 | 119.0 |
| April, 1928 | 119.3 |
| March, 1928 | 118.2 |
| May, 1927 | 120.7 |
| Average first five months of 1928 | 120.5 |
| Average first five months of 1927 | 117.3 |

The rate of operations in the rolling mills and steel plants was quite significant, standing at almost the same in April and even above that of March. The usual seasonal decrease in the rate of activities of this industry has not been made apparent so far this year. The May operations were about 2.1 per cent over those of May last year. The ferrous and non-ferrous metal working plants have also increased their rate of operations during the past two months, and in May were operating on a plane about 12.5 per cent over last year. The volume of production in these plants since the opening of the year has been about 10 per cent over that of last year. Decreased activities are evident in the automobile industry, May operations being about 4.7 per cent under April, but still 7.6 per cent above May last year.

# Business News and Market Conditions

## Sales Conference Undertakes Market Study

In furthering its work of developing a selling program for all branches of the industry, the Electrical Industry Sales Conference, through its sales plan committee, has engaged marketing counsel to undertake immediately a research study into all consumer and industry factors governing the market for adequate wiring in the home. Out of the facts obtained will be built the co-operative selling plan for early presentation to the industry. The sales plan committee investigated the field of research and advertising and, after receiving the presentations of a number of representative firms, selected the J. Walter Thompson Company, New York. Messrs. J. E. Davidson, chairman; G. E. Cullinan, vice-chairman; W. E. Sprackling, L. W. Davis, J. E. North and J. L. Ray comprise the sales plan committee, which is also to function as the working contact committee through the study and development of the selling plan.

It will be recalled that, in approaching its work in a definite way, the Electrical Industry Sales Conference, appointed for the purpose of considering and developing a national sales program for the industry, adopted at its first meeting the following resolutions:

That the Industry Sales Conference make as its first objective the development of a broad industry program for its promotion of more adequate house wiring through an organized national movement to rewire the houses now connected to power systems of America where the installations provide inadequate facilities

for the use of complete electrical equipment and also to establish a higher standard of adequacy in the wiring of new houses.

That the conference recognizes that the present status of the electrical house wiring contractor will prove a fundamental factor in the carrying out of any program to promote house wiring and that careful study should be given to this problem in the hope that a way may be found to increase his effectiveness as a creative influence in the development of the electrical market.

The problem of increasing the effectiveness of the house wiring contractor is being considered as the subject of a special program for industry action and is not within the scope of the work assigned to the agency, although, of course, the house wiring contractor will be one of the elements to be considered in the development of the main selling plan.

The scope of the work for which the agency has been engaged is stated as follows:

1. Approaching the problem with the attitude of fundamental analysis, the necessary investigation is to be made which will provide a clear understanding of the market to be influenced, geographically and psychologically, with regard to this problem, as a basis of definite knowledge on which to proceed. This investigation will refer to the present objectives of the conference, as distinguished from a broader investigation of the whole marketing situation of the industry.

2. Interpret the findings of this investigation in the light of broad merchandising experience and with an outside viewpoint.

3. Prepare a comprehensive all-industry selling program founded on the conclusions reached, and comprised of two parts, viz.:

(a) A complete and self-contained localized selling plan, suited to successful promotion and operation in any community. This would be designed as a local co-operative plan, with participation by the electric utility, jobber, contractor, dealer and manufacturer's local representatives.

(b) A national phase to give a national background of advertising and publicity, and to provide the bond for tying the local programs into a national movement.

(It is expected that the program will be built around a new and effective approach that will grip public imagination.)

4. Develop an effective plan for presenting the main selling program to the electrical industry in a way to secure the necessary financial support and participation throughout the country. The industry's existing national and local facilities would, of course, be counted on to perform their proper functions.

Funds for the preliminary investigation and development of the plan have been made available by the national associations. The conference is handling the business arrangements through the board of directors of the Society for Electrical Development and members of the staff are assisting the sales plan committee and the agency in their work.

# Market Conditions

STEADY sales reached an aggregate good volume in New England, although individual orders were small. Motor sales were strong and negotiations for heavy equipment are promising. A Massachusetts mill bought $8,000 worth of control equipment. In the Eastern district central-station business shows an upward trend, both as to contracts and inquiries. A Diesel engine unit was purchased by a power company in Georgia and two substation equipment orders from New Jersey and New York totaled $53,000. The market for street-lighting equipment has improved.

The volume of business in the Southeast is up and consists of many small orders. An order for $125,000 worth of power transformers, placed by a company in Alabama, was the only sale of moment. Motors and other electrical equipment purchased by textile mills in Georgia amounted to $23,000. In the St. Louis district general conditions are fair, but sign business is reported as especially good. A substantial volume of business is noted in the Middle West and appears to be increasing from month to month. On the Pacific Coast many equipment orders were placed. Mining and lumber companies were prominent buyers. The Utah Copper Company ordered apparatus for its Bingham plant at a cost of $175,000, and the Miami Copper Company purchased $550,000 worth. The Weyerhauser Company closed a contract for two 750-kw. turbines, costing $230,000, for its mill at Longview, Wash. Seattle will build a substation to cost $1,000,000 complete. Contract for the construction of the Leaburg unit of the Eugene-Oregon hydro-electric project has been let to A. Guthrie & Company of Portland at a cost of $1,029,230.

## *Non-Ferrous Metals Firm at Unchanged Price Levels*

Firm and steady markets for the major non-ferrous metals, tin alone excepted, are the feature. Copper is in fair demand in the domestic market and in exceptionally strong demand from abroad, prices are firm and the possibility of another price advance in the near future is heard. Lead is firm with sales but little below normal. Buyers have re-entered the market for zinc in fair volume and the price is slightly higher than a week ago. Tin is easier and statistics continue to show a mounting production rate.

NEW YORK METAL MARKET PRICES

| | June 6, 1928 Cents per Pound | June. 13, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic..... | 14.525 | 14.525 |

| Nickel, ingot........... | 35 | 35 |
| Zinc spots.............. | 6.487 | 6.50 |
| Tin, Straits............. | 49.50 | 48 |
| Aluminum, 99 per cent... | 24.30 | 24.30 |

Base copper wire price June 13, 1928, 16⅞ cents.

## *Utility Demand Improves in Eastern District*

Central-station business shows an upward trend in the Eastern district, both with regard to contracts and inquiries. A power company in Georgia has placed an order for a Diesel engine unit for a stand-by steam-electric station with a leading manufacturer in northern New York. A municipality in Missouri has contracted for a turbo-generator unit, with condenser and auxiliaries. A New Jersey central-station company has given an order for transformers and accessory apparatus to total about $25,000, and other contracts are anticipated from this same quarter. A metropolitan utility has placed a similar commitment for substation service, the order aggregating about $28,000. Switching equipment sales give signs of improvement and sizable transactions are expected at an early date. The market for transmission cables, fittings, etc., likewise gives indication of better conditions, following several weeks of lagging interest. Electric equipment for marine service is another branch in which demand is anticipated.

Industrial account continues to be an appreciable factor in the Eastern district, even though the call for motors of industrial ratings shows a little decline, which is considered only as temporary. Meantime, a number of contracts have been placed for prime movers and kindred heavy machinery. A chemical company in New Jersey has ordered a turbo-generator unit, with air-cooled equipment, to cost more than $110,000. An order also was placed for a motor-generator set, with switchboard panel, etc. [illegible] mach[illegible] [illegible]t in northern New York [illegible]. Another [illegible] [illegible]ator sets re[illegible] [illegible]ective c[illegible] telegraph company, one order being placed for 125 such units, from 300 to 750-watt rating. Metal-working plants are still in the market for electrical equipment requirements, with other inquiries coming from cement mills, shoe and leather factories, and textile mills. Ice-manufacturing plants are also seeking apparatus and a sizable account is looked for from this branch of activity. In connection with industrial equipment, a leading manufacturer reports that the price trend is downward, while central-station machinery shows development in the other direction. Resale motor business is becoming more pronounced in this section and a considerable quota of recent commitments are of this character. Construction operations in the Eastern district are as follows:

The Westchester Lighting Company, Mount Vernon, N. Y., plans a substation on Waverly Avenue, Mamaroneck, N. Y., to cost $45,000. The Nichols Copper Company, Laurel Hill, L. I., has purchased property at El Paso, Tex., and will build an electrolytic copper refinery to cost $3,000,000. The Royal Typewriter Company, New York, will add to its factory at Hartford, Conn., to cost $150,000. The West Virginia Pulp & Paper Company, New York, plans an expansion program at its mill at Mechanicsville, N. Y., to cost $650,000. County Supervisors, Rochester, N. Y., plan a highway lighting system for Pittsford, Brighton and other communities. Niagara Falls, N. Y., plans extensions and improvements in the street-lighting system. The Public Service Electric & Gas Company has approved plans for a substation at Jersey City, N. J., to cost $85,000.

J. Lichtman & Sons, Newark, N. J., will add to its leather tannery to cost $300,000. Matawan, N. J., contemplates an improved street-lighting system. The Deborah Sanatorium, Lake Hopatcong, N. J., will build a power plant in connection with new institutional buildings, to cost $800,000. The Ward Baking Company plans a new baking plant at Elizabeth, N. J., to cost $350,000. The United Varnish Company, North Bergen, N. J., will build a factory to cost $90,000. The Atlantic Refining Company, Philadelphia, plans an electric-operated storage and distributing oil works at Jacksonville, Fla., to cost $100,000. The George K. Hale Manufacturing Company, Philadelphia, plans a new bone button factory at Mount Airy, N. C., to cost $75,000. The Pennsylvania Power & Light Company plans extensions in transmission lines from Nescopeck to Dorrance Township, Pa. The Bethlehem Shipbuilding Corporation, Baltimore, Md., plans a fabricating and machine shop addition to cost $400,000.

### Substantial Business Noted in Middle West

There is a substantial volume of business being transacted in the Middle West in a varied line of industry, which appears to be increasing from month to month. An increasing amount of construction work is under way, with a slightly decreasing number of unemployed. Indications seem to point to better business ahead, with a favorable month for June. The various utility companies are busy with construction and line extension work and a large amount of underground construction work is in [illegible]

[illegible] ordered were two [illegible] minute air filters, one [illegible] 12,[illegible] distribution transfor[illegible] 550 direct-current watt-hour meters, 250,000 lb. weatherproof wires and cables, 161 overcurrent relays and a quantity of current transformers. Construction projects are as follows:

The Western Packing Provision Company, Chicago, plans a plant to cost $185,000. The Sanitary District of Chicago is planning a power substation, near Western Avenue Terminal to cost $75,000. The Toledo, Peoria & Western Railroad, Toledo, Ohio, will build an engine house and shops at East Peoria, Ill., to cost $100,000. The Central Illinois Public Service Company, Springfield, Ill., is planning an equipment storage and distributing plant to cost $55,000. The Penberthy Injector Company, Detroit, plans an addition to cost $100,000. The Fountainway Corporation, Cincinnati, Ohio, plans a factory to cost $90,000. Steel & Tubes, Inc., Cleveland, plans a plant at Ferndale, Mich., to cost $750,000. The Puritan Dairy, Inc., Beloit, Wis., plans an ice cream plant to cost $85,000. Austin, Minn.; Biwabik, Minn.; Lincoln, Neb., and Madison, Wis., plan ornamental lighting systems. New Ulm, Minn., will soon ask bids for an improved lighting system. Neenah, Wis., will ask bids about July 1 for an ornamental lighting system.

### Small Orders in Good Volume Mark New England Sales

Sales of electrical equipment in the New England district were steady and the volume good, according to reports from several manufacturers. Small motor sales were strong. A number of 50-hp. and larger motors were placed. Negotiations for heavy equipment are promising, especially for turbo-generators. Small switches and power apparatus sales were encouraging; in fact, the trend appears stronger in this line. Orders for about $8,000 worth of control equipment were received from a Massachusetts mill, and smaller orders are quite numerous. A number of loom motors were ordered and contractors' equipment is in good demand. An order for a 145-hp. motor and control for rock-crushing machinery is noted and two laundry installations are of interest, including motor drives throughout amounting to over $5,000 in electrical equipment.

Specialties are attracting interest. Arc welders are being considered for assembly work in tool machines with attention, in particular, to new types of loom machinery. Eleven electric clocks, regulated from a master clock of the Boston Edison Company, will be installed in the new North Station. Electric refrigerators are gaining rapidly in popularity. Electric appliances show a substantial gain in volume. An important construction project reported is as follows:

The Grafton Power Company, Lebanon, N. H., plans a hydro-electric power plant on the Connecticut River, near Littleton, N. H., to cost $25,000,000.

### Volume of Sales Up Despite Small Orders in Southeast

With the exception of a power transformer order, amounting to $125,000, from a power company in Alabama, no orders of moment are being placed by central-station companies in the Southeast except in connection with merchandising activities. A power company in Mississippi ordered small power transformers totaling $2,500 and a Georgia company ordered creosoted pine poles amounting to $2,000 and distribution transformers costing $1,100. Two municipalities in Georgia ordered four carloads of creosoted pine poles each. The total volume of business is holding up remarkably well, even though the bulk of orders is individually small.

Inquiries from industrial plants are on the increase and a satisfactory amount of business in this field is reported. One textile mill in Georgia has undertaken electrification and ordered $10,000 worth of motors and approximately the same amount in wiring materials. Two other cotton mills in the same state ordered motors and miscellaneous electrical equipment amounting to $7,000 and $6,000, respectively. Plans have been made for moving South a textile mill which will form the second unit of a Georgia mill and the wiring materials in this unit will approximate $25,000. Construction projects are as follows:

The Volunteer Knitting Mills, Athens, Ala., plan an addition to cost $100,000. The Alabama Power Company, Birmingham, Ala., has applied for permission to construct 200 miles of transmission lines in different parts of the state. The Louisville & Nashville Railroad Company, Louisville, Ky., will make improvements in repair shops and terminal at Mobile, Ala., to cost $125,000. The West Florida Power Company, Jasper, Fla., plans a transmission line from Quincy to Gretna, Fla., to cost $85,000. The Commodore Point Terminal Company, Jacksonville, Fla., plans an ice plant to cost $100,000. The Baker County Power Company, Newton, Ga., plans a steam power plant to cost $200,000. The Kentucky Utilities Company, Louisville, Ky., has acquired properties of the General Power & Light Company at Calhoun, Rumsey, Poole, Sebree, Ky., and plans transmission line construction, etc. The Mississippi Power Company, Gulfport, Miss., has acquired a power plant at Picayune, Miss., and plans new transmission lines. The company will also build transmission lines to Russell and Kewanee, Miss. Bennettsville, S. C., plans extensions in its municipal power plant. The Plough Chemical Company, Memphis, Tenn., plans an addition to cost $500,000.

### Sign Business Especially Good in St. Louis District

No change in general conditions is reported in the St. Louis district. An order for transformers and substation equipment was placed at a cost of $3,500. The electric sign manufacturers report the demand is holding up unusually well. Orders for small motors and transformers continue about normal. Fan business has been good and all appliances are moving in good volume. Construction projects are as follows:

The Wilson Power & Light Company, Wilson, Ark., plans extensions in its power plant and system, to cost $100,000. The Eldorado Refining Company, Eldorado, Kan., will build an oil refining plant to cost $100,000. The Satanta Terminal Elevator Company, Satanta, Kan., plans a grain elevator, to cost $100,000. The Gulf Public Service Company, New Iberia, La., is negotiating for the purchase of municipal power plant at Lafayette, La., and plans extensions and transmission line construction. The West Coast Kalsomine Company, San Francisco, plans a plant at New Orleans, La., to cost $85,000. The Page Milk Company, Merrill, Wis., plans a plant at Marshall, Mo., to cost $200,000. The Universal Cutter Company, St. Louis, plans a plant to cost $80,000. The St. Louis Smelting & Refining Company, New York, will build an ore mill at Quapaw, Okla., to cost $125,000. The Burton Packing Company, Burton, Tex., plans a meat-packing plant at Houston, Tex., to cost $100,000. The Texas-Mexican Refining Company, Laredo, Tex., plans extensions in its oil refinery to cost $125,000. Smith Brothers Properties, Inc., San Antonio, Tex., is planning a cement mill near the city to cost $1,000,000, and a power plant is projected. Waco, Tex., has authorized a fund of $3,500,000 for municipal waterworks. Jonesboro, Ark.; Fort Stockton, Tex.; San Antonio, Tex., and St. Louis, Mo., plan ornamental lighting systems. The Empire District Electric Company has concluded a contract with Joplin, Mo., for an ornamental lighting system.

## *Many Equipment Orders Placed on Pacific Coast*

Power companies and industrial plants, especially mining and lumber companies, bulk large in the week's orders on the Pacific Coast. The Utah Copper Company has bought four 1,000-kva. rotary converters and complete automatic substation equipment for its Bingham plant at a cost of $175,000. The Miami Copper Company of Miami, Ariz., has ordered a 15,625-kva. turbine, twelve locomotives, five 200-kva. transformers, three 150-hp. motors and a seven-panel switchboard at a value of $550,000. Power company ordering has included $4,500 worth of miscellaneous hardware, one-half carload of bare copper wire, etc. Prospective power company business includes 1928 pole requirements for the San Joaquin Light & Power Corporation, comprising 8,200 poles for delivery during September, October and November, with an estimated value of $115,000.

The Seattle City Council has authorized the immediate construction of the Spring Street substation to cost $1,000,000 complete. A contract was let by the British Columbia Electric Railway Company for the first 20,000-kw. turbo-generator unit for its Vancouver plant. A. Guthrie & Company, Portland, will construct the Leaburg unit of the Eugene-Oregon hydro-electric project at a cost of $1,029,230. A contract for two 7,500-kw. turbines costing about $230,000 was placed by the Weyerhauser Company for its lumber mill at Longview. Motor and transformer orders pending total $160,000. Construction projects are as follows:

The Big Jim Mines, Inc., Patagonia, Ariz., plans a milling plant to cost $100,000. The Wenden Copper Mining Company, Wenden, Ariz., plans a mill and reduction plant to cost $100,000. The People's Hydro-Electric Corporation, Alturas, Calif., plans a hydro-electric power plant on Pine Creek to cost $100,000. The Illinois-Pacific Glass Company, San Francisco, plans a plant at Vernon, near Los Angeles, to cost $300,000.

The Pacific Lumber Company, Scotia, Calif., plans a power project on the Eel River, Humboldt County, in connection with proposed pulp and paper mill to cost $2,000,000. The Commonwealth Utilities Corporation, Colorado Springs, Colo., plans a transmission line from the Manitou power plant to cost $30,000. The Farm Light & Power Company, Howell, Wyo., plans extensions in transmission lines. Los Angeles and Bakersfield, Calif., and Vancouver, Wash., are planning to add to their ornamental lighting systems.

# Activities of the Trade

### Malleable Iron Fittings Appoints General Sales Agent

Announcement has been made by the Malleable Iron Fittings Company, Branford, Conn., of the appointment of the Line Material Company, South Milwaukee, Wis., as general sales agent throughout the greater part of the United States for the pole hardware department of the company. The territory reserved for direct sales by the Malleable Iron Fittings organization consists of all the New England states, Westchester County and Metropolitan New York, including Long Island, Staten Island and the five northeasterly counties of New Jersey. The company manufactures Williams pole mounts, reinforcing and extension clamps for tubular iron poles, cable suspension clamps, catenary clamps, wood pole top extensions and other pole hardware.

### Salesmen and Purchasing Agents Elect Officers

A. H. Jones, Bryant Electric Company, Bridgeport, Conn., was elected president of the Salesmen's and Purchasing Agents' Association of America at a recent meeting. At that time R. T. Phipps, Bullard Machine Tool Company, Bridgeport, was chosen vice-president; W. B. Osborne, Erie Malleable Iron Company, Erie, Pa., secretary, and W. H. Bradley, Hunter & Havens, Bridgeport, treasurer.

R. T. Phipps, past treasurer, was given a gold watch and chain in recognition of his work in promoting the first exhibition of the association. It is expected that a second exposition will be held in Bridgeport early in 1929. The retiring president, H. J. Behn, Hunter & Havens, Bridgeport, also was given a unanimous vote of thanks.

### Economy Fuse Buys Federal Fuse Business

The purchase of the "Federal National" renewable fuse department, including all material, physical property, patents and good will of the "Federal National" renewable fuse from the Federal Electric Company of Chicago, has been announced by the Economy Fuse & Manufacturing Company of Chicago. The Economy company is already under complete production and will market this fuse under the trade name "National." The company states that slight modifications in the original design of the fusible element have been made. The National renewable cartridge fuse is now listed as standard in all capacities up to 600 amp. in both the 250 and 600-volt types in the April, 1928, list of inspected electrical appliances, under the label service form of supervision by the Underwriters' Laboratories.

The plan of the company in marketing the "National" fuse will be to serve the users, contractors and dealers through the electrical wholesalers under a plan similar to its policy in the marketing of Economy renewable cartridge fuses. The company also announces that T. D. Halliwell, formerly manager of the wiring device and thermal control sections of the Westinghouse Electric & Manufacturing Company in its merchandising department at Mansfield, Ohio, has been appointed assistant to the president.

The Buffalo Foundry & Machine Company, Buffalo, N. Y., manufacturer of driers, evaporators and chemical equipment, announces the opening of an office in San Francisco, in charge of Charles O. Lavett.

The O. C. White Company, Worcester, Mass., manufacturer of adjustable electric light fixtures, announces the appointment of James A. Vaughan, 1104 Packard Building, Philadelphia, as its representative in the Philadelphia territory.

The Ohio Electric & Controller Company, Cleveland, manufacturer of lifting magnets and small motors, announces the appointment of the Charles L. Ward Company, 701 Midland Building, Kansas City, Mo., as its representative in Kansas City; Omaha, Neb.; Dallas, Tex., and the territories adjacent to these cities. J. Dale Reynolds, Apartado 428 Monterey M. L., Mexico, has been made the company's representative in Mexico.

Baker & Spencer, Inc., 117 Liberty Street, New York City, engineers, announce that after June 1 their address will be 17 Battery Place, New York City.

Landers, Frary & Clark, New Britain, Conn., manufacturers of appliances, announces the "Universal" vacuum auto cleaner, which also is adapted for use in stores, offices, etc., and as a complement to the regular cleaner in the home.

Kliegl Brothers, 321 West Fiftieth Street, New York City, manufacturer of stage-lighting equipment, announces that electromagnetic operation of color frames on Kliegl spotlights is now available.

Curtis Lighting, Inc., Chicago, manufacturer of "X-Ray" reflectors, announces the appointment of Roy D. Myers as resident engineer for northern California with offices at 414 Foxcroft Building, San Francisco. Mr. Myers has been in charge of the lighting service bureau of the Northern States Power Company, St. Paul, Minn., for the past nine years.

# New Equipment Available

## Insulation Which Can Be Punched Cold

Improvement in the punching grades of Formica, manufactured by the Formica Insulation Company, 4638 Spring Grove Avenue, Cincinnati, has now made it practical to shear the stock cold and punch it cold up to and including 3/32 in. thick. The material is available in natural brown or black colors. The manufacturer claims that this workability has been attained in a stock that has been fully cured. There is no increase in price for the material as compared to the former grade. A sample can be secured from the manufacturer for testing.

## Corrosion-Proof Coating

A corrosion-resisting coating which the manufacturers claim can be applied economically and which has been successfully applied to products ranging from battery handles to copper conductors and various classes of sheet metal is being offered by the "Amaloy" division of the American Machine & Foundry Company, 511 Fifth Avenue, New York. Any metal subject to corrosion may be Amaloy-coated. Amaloy is a single continuous coating of practically pure lead which forms a chemical bond with the coated metal without alloying or impregnating it. It is said to form a perfect corrosion-proof adherent incasement that will not crack, check or split off the base metal.

In a test conducted at the New York Testing Laboratories two identical 6-in. wrought-iron pipe nipples were submerged in a bath of 18 per cent by weight sulphuric acid for 44 hours after one had been coated with Amaloy and the other had been coated with zinc spelter galvanized in the same manner as commercial galvanized pipe. At the end of the test the Amaloy-coated pipe showed a loss by weight of 1.6 grains. The galvanized pipe showed a loss of 134 grains.

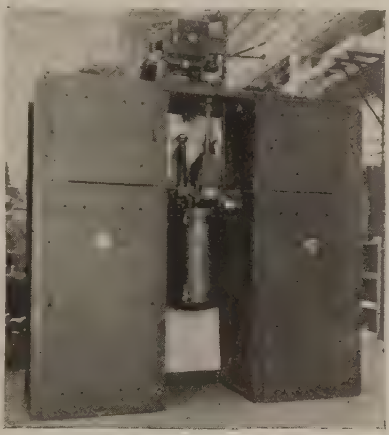
## Portable Air Compressor

A new size of portable air compressor has been placed on the market by the Ingersoll-Rand Company, 11 Broadway, New York. This makes the seventh size in the company's line of its portable air compressors. This new size, 4¾-in. bore by 4-in. stroke, has a piston displacement of 82 cu.ft. per minute. It is intended primarily for use by contractors, public utilities, cities, towns, etc., requiring a unit of slightly larger capacity than the 4¼-in. x 4-in. machine.

The new compressor, like the other I-R portables, is equipped with a four-cylinder, tractor-type Waukesha motor. It is available on broad-faced steel wheels, on steel wheels with rubber tires, on I-R trailer mounting, on Ford or Chevrolet truck, or without running gear for mounting on skids, railway cars, etc. This unit embodies all the Ingersoll-Rand features which are found on the other six sizes.

## Steel Structures for Circuit Breakers

A circuit breaker mounted in a fabricated steel structure designed to replace the concrete has been developed by the Westinghouse Electric & Manufacturing Company. The circuit breaker is built complete at the factory. The company states that time and expense of installation are materially reduced by using the steel structure because the building of forms, the pouring of the concrete and the cleaning up for installation of apparatus are eliminated. The time of preparing for service is materially reduced because of the unit construction of the apparatus, which also is shipped as a unit. It is only necessary to put the breaker in place, bolt it down, remove the blocking, check the adjustments, connect it to the control circuits and the bus, put in the oil and it is ready for service.



*Circuit breaker mounted in a fabricated steel structure designed to replace a concrete cell*

The steel structure, the company claims, is better suited for this service in that the operation of the breaker imposes shocks on the supports. Steel, by its elastic characteristics, absorbs the shocks easily with no damage to itself. Although the structure shown exactly replaces a concrete structure, it is possible to reduce the space occupied by taking advantage of the greater strength of the steel. The steel frame is lighter than the concrete structure, which results in an indirect saving in that the floors and main building can be lightened because of the decreased load carried. In the structure shown the circuit breaker only is supported. The use of steel can be extended to support the disconnecting switches and further to support the bus, with corresponding savings.

## Portable Instruments

A new line of portable alternating and direct-current instruments has been placed on the market by the Westinghouse Electric & Manufacturing Company. The alternating-current instruments are designated as the type PY5. They are of the direct-reading type and are applicable for general testing and laboratory work where high accuracy is required. The voltmeters and single-phase wattmeters are of the electrodynamometer type. The ammeters are of the moving iron type using vanes of non-residual metal. All instruments are shielded and are damped by an improved design of air damper. The ammeters have a double range which can be changed while the meter is in use by a series-parallel switch mounted in the case. They may be used on circuits up to 500 cycles and also on direct current with but slight reduction in accuracy.

The direct-current instruments are known as the type PX2 and are particularly suitable for automobile, battery, radio and miscellaneous testing. They are of the permanent magnet moving-coil type and operate on the D'Arsonval principle. This line of instruments includes millivoltmeters, double-range voltmeters, milliammeters, ammeters, radio frequency ammeters and galvanometers.

RENEWABLE CARTRIDGE FUSE.—A redesigned line of renewable cartridge fuses has been placed on the market by the Star Fuse Company, 235 Canal Street, New York. The fuses are said to be simple in construction and from the smallest to the largest size can be assembled without the use of tools. The renewable element is inclosed in a fiber tube. The company also claims that by reason of this construction a pressure, which is created in the refill, chokes the arc formed when a fuse blows on a short circuit.

CRANE PANELS.—The revision of its line of crane protective panels bearing the designation CR-7409 is announced by the General Electric Company. Such panels provide overload and undervoltage protection for all the motors of a crane and are designed to be used with an emergency switch for use by the operator in an emergency. They may be used with either drum switches or magnetic control panels. The principal change in the revised line is a regrouping of the units involved, resulting in a decided reduction in total size. Another change is the substitution of instantaneous overload relays instead of dashpot overload relays. Otherwise the equipment is practically the same as before, except that up-to-date material is used in all cases.

# Electrical Patents

*Announced by U. S. Patent Office*

*1,669,112. Supervisory Control System; F. H. Winter, Schenectady, N. Y. App. filed Sept. 15, 1924.

(Issued May 15, 1928)

1,670,218. Means for Preventing Current Leakage in Electric Cables; H. R. Searing, New York, and E. Williams, Jackson Heights, N. Y. App. filed March 11, 1927. Insulation of high tension cables.

1,670,227. Oil-Immersed Electric Switch; W. Anderson, Herburn-on-Tyne, England. App. filed Nov. 22, 1926.

1,670,237. Electrically Heating the Ends of Rock Drills and the Like; B. D. Bushell, Springs, S. E. T. Ewing, Johannesburg, and E. H. D. Brunner, Springs, Transvaal, South Africa. App. filed Aug. 7, 1926.

1,670,259. Electrical Conduit Fitting; J. J. Herlbauer, New York, N. Y. App. filed Sept. 28, 1926.

(Issued May 22, 1928)

1,670,292. Tungsten Filament and Method of Making It; F. Blau, F. Koref and K. Moers, Charlottenburg, Germany. App. filed Nov. 29, 1924.

1,670,334. .Terminal for Bushing Insulators; A. O. Austin, Barberton, Ohio. App. filed July 29, 1922.

1,670,419. Blasting Gun; W. S. Mayer, Philadelphia, Pa. App. filed March 6, 1924. With means for furnishing an electric current.

1,670,429. Pin for Insulators; J. P. Arndt, South Milwaukee, Wis. App. filed Dec. 31, 1920. Which may be arranged in different positions on the cross arm and can be used on cross arms of different sizes.

1,670,437. Electrically-Heated Steam Boiler; C. W. Campbell, Denver, Colo. App. filed April 8, 1926.

1,670,439. Motor Controller; F. F. Dorsey, Rochester, N. Y. App. filed April 30, 1924. As used with a power-driven typewriter.

1,670,506. Electric Water Heater; A. Johnson, Oakland, Calif. App. filed April 6, 1927. Wherein a relatively small quantity of the total storage capacity may be maintained highly heated for use when desired, or by the operation of a valve the entire capacity of the heater may be maintained at a high temperature.

1,670,581. Continuous-Current Variable-Speed Machine; F. Kesselring, Furth, Germany. App. filed April 6, 1927.

1,670,585. Container for Granular Depolarizers and Process of Making the Same; G. A. Lyon, Miami, Fla., R. W. Erwin, Flushing and G. W. Heise, Bayside, N. Y. App. filed Jan. 5, 1923.

1,670,590. Dry Cell; J. J. McCann, Kearny, N. J. and C. G. Birdsall, Elmhurst, N. Y. App. filed Aug. 26, 1924.

1,670,604. Dry-Cell Lining; V. Yngve, South Orange, N. J. and W. E. Vail, New York, N. Y. App. filed April 6, 1925.

1,670,634. Battery Connection; G. J. Ocker, Troxelville, Pa. App. filed June 24, 1925. For the terminal posts of a storage battery.

1,670,640. Conductivity Cell; I. B. Smith, Ambler, Pa. App. filed May 20, 1925. For measuring the resistivity or conductivity of materials whose resistance change with temperature as an electrolyte.

1,670,649. Circuit Breaker; L. L. Brown, Spokane, Wash. App. filed July 12, 1927. Of the foot operated type, designed for use as a portable switch mechanism in an electric lamp circuit.

1,670,662. Hoistable Combined Disconnecting Switch and Fuse for Outdoor Transformers and Transmission Lines; E. Johnson, Partille, Sweden. App. filed Jan. 14, 1924.

1,670,682. Signaling Device; C. A. B. Halvorson, Jr., Lynn, and R. B. Hussey, Swampscott, Mass. App. filed March 14, 1923. Adapted for signaling to or from aeroplanes.

1,670,697. Electrical Apparatus; E. D. Treanor, Pittsfield, Mass. App. filed April 6, 1926. Safety appliance for encased electrical apparatus such as transformers filled with an inert gas under heavy pressure. Safety appliance responsive to variations in the gas pressure.

1,670,699, 1,670,700. Electric Welding; J. M. Weed, Scotia, N. Y. Apps. filed April 28, 1925, and July 29, 1927.

1,670,716. Heat Deflector for Incandescent Lamps and Similar Devices; J. F. Donovan, Cleveland, Ohio. App. filed Nov. 12, 1923.

1,670,746. Thermostatically-Controlled Mechanism; O. C. Schroeder, Chicago, Ill. App. filed Nov. 19, 1924. As embodied in an oil burner structure.

1,670,759. Electrical Device; J. Berg, Chicago, Ill. App. filed April 21, 1923. Extension cord on reel take up.

1,670,767. Electric Water Heater; A. A. Grassi and R. de O. Cézar, Buenos Aires, Argentina. App. filed Aug. 30, 1926.

1,670,792. Method of and Apparatus for Checking the Connections of Watt-Hour Meters to the Instrument Transformers and to the Line; W. C. Woodson, Jr., Brooklyn, N. Y. App. filed Sept. 1, 1927.

1,670,793. Program Device; J. W. Yates, Cincinnati, Ohio. App. filed Dec. 21, 1921. For ringing a bell at desired intervals.

1,670,819. Fuel Igniter; W. L. Morris and W. K. Booth, Chicago, Ill. App. filed Sept. 11, 1922.

1,670,824. Motor-Power Reverse Gear; R. S. Roth, Fond Du Lac, Wis. App. filed July 21, 1925. For locomotives.

1,670,846. Zoned Resistor for Electric Furnaces; F. T. Cope, Salem, Ohio. App. filed Feb. 24, 1925.

1,670,856. Control Panel; G. W. Hyser, Minneapolis, Minn. App. filed June 18, 1927. For theater lighting.

1,670,897. Brake-Magnet Adjustment; R. Mercier, Paris, France. App. filed July 22, 1925.

1,670,922. Electric Switch; C. E. Anderson, Stratford, Conn. App. filed May 18, 1921. Multiple switches, lever type, asembled to independently control a group of circuits.

1,670,985. Electric Protection of Transformers; G. L. Porter, Benton, England. App. filed April 13, 1925. Using "split conductor protection."

1,670,998. Singer; H. C. Vollmer and G. H. Repke, Flint, Mich. App. filed May 23, 1927. Electric hair singer.

1,671,016. Storage-Battery Terminal; F. G. Dewey, Anderson, Ind. App. filed Dec. 13, 1924.

1,671,026. Electric Furnace; C. H. Gage, Washington, D. C. App. filed Feb. 12, 1926. Continuous feed type.

1,671,033. Gas and Electric Drive for Vehicles; C. I. Kimura, Chicago, Ill. App. filed Dec. 22, 1925.

1,671,046, 1,671,047. Hydro-Electric Installation; A. Pfau, Milwaukee, Wis. Apps. filed Sept. 6, 1921, and April 1, 1922. Where the hydraulic machine is operative under or against a widely varying head.

1,671,068. Electrical System; E. I. Deutsch, Milwaukee, Wis. App. filed April 20, 1918. An electrical generator in which the voltage is kept constant and in which a constant maximum speed is obtained by substantially limiting the speed so that it cannot exceed a given value.

1,671,076. Induction-Motor-Control System; F. Jeffrey, Milwaukee, Wis. App. filed May 29, 1920. Where the control is exercised through a rotary converter and a direct current machine interconnected with the induction motor.

1,671,077. System of Distribution; J. J. Kane, Milwaukee, Wis. App. filed July 24, 1915. Device for regulating generators connected to supply variable loads, especially where there is a tendency for a generator to operate at widely different speeds.

(Issued May 29, 1928)

1,671,145. Electric Regulation; J. L. Creveling, Tucson, Ariz. App. filed April 3, 1917. For generator used in railway car lighting.

1,671,173. Process and Device for the Protection of Metallic Parts Against Corrosion; F. von Wurstemberger, Zurich, Switzerland. App. filed April 30, 1924.

1,671,196. Electric Switch; W. J. Larson, West Hartford, Conn. App. filed Jan. 25, 1927. Push and pull type, adapted to be applied to a panel for testing electric apparatus, such as relays, meters and other instruments.

1,671,218. Motor Controller; W. O. Baer, Milwaukee, Wis. App. filed March 5, 1925. For synchronous motors.

1,671,226. Lamp Socket; L. Caruso, Irvington, N. J. App. filed Oct. 2, 1925. Combined lamp socket and supporting bracket suitable for holding miniature lamps.

# New Trade Literature

SWITCHING AND PROTECTIVE EQUIPMENT.—The Hi-Voltage Equipment Company, Cleveland, has issued bulletin No. 15 covering a complete line of 132,000-volt switching and protective equipment. This bulletin contains illustrations showing various installations, and different types of the equipment. Drawings and operating data also are included.

CONTROL APPARATUS. — "Keeping Pace in the Newspaper Plant" is the title of a catalog issued by the Cutler-Hammer Manufacturing Company, Milwaukee. The catalog contains descriptions of the function and the operation of the press control, press drives, newspaper conveyors, etc., developed by the company. It also gives the advantages of each particular style of apparatus and shows how large and small plants alike are using the equipment to best advantage. Many illustrations showing actual installations are included.

ELECTRIC EQUIPMENT FOR GRAIN ELEVATORS, ETC.—The General Electric Company, Schenectady, N. Y., is distributing the following bulletins: GEA-767A, covering the new totally inclosed fan-cooled grain elevator motors, GEA-882, covering direct-current, induction and synchronous motors and control particularly adopted to plate-glass manufacture; GEA-883 covering equipment for bottle-glass plants; GEA-955, describing electric equipment for cotton gins and GEA-241A describing oil well pumping equipment.

ELECTRIC WATER HEATERS.—Reports of electric water heating tests on low wattage heaters conducted by the Russell Sage Laboratory of the Rensselaer Polytechnic Institute, Troy, N. Y., has been issued by the Hynes & Cox Electric Corporation, Albany, N. Y. It contains information and data with performance charts of the "Red Crown Duostat" electric water heater on which the tests were made.

INSTRUMENTS AND LIGHTING ARRESTERS.—Bulletin GEA-402A issued by the General Electric Company, Schenectady, N. Y., covers its direct-current miniature portable instruments and bulletin GEA-93B covers the pellet-type oxide film lightning arresters.

GROUND RESISTANCE TESTER. — "Measurement of the Resistance to Earth of Ground Connections" is the title of technical bulletin No. 1185, issued by James G. Biddle, 1211 Arch Street, Philadelphia, covering the "Megger" ground resistance tester. The bulletin includes a description of the new direct-reading "Megger" ground resistance tester, comparison of various methods of test and data on the characteristics of earth.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase is desired in Hamburg, Germany (No. 31,668), of flash-light batteries.

Purchase and agency are desired in La Guaira, Venezuela (No. 31,652), for automobile storage batteries.

An agency is desired in Wellington, New Zealand (No. 31,676), for household electrical appliances.

An agency is desired in Merida, Mexico (No. 31,655), for household refrigerators.

Purchase and agency are desired in Johannesburg, South Africa (No. 31,670), for household refrigerators.

Purchase is desired in Newcastle, England (No. 31,569), of traffic signals and devices.

An agency is desired in Edmonton, Canada (No. 31,673), for turbo-generator sets and mercury arc rectifiers.

An agency is desired in Leipzig, Germany (No. 31,672), for domestic washing machines.

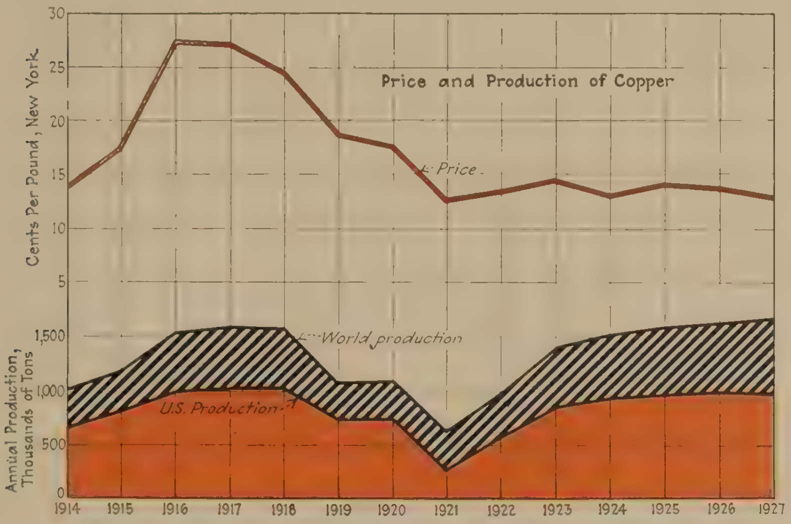
An agency is desired in Toronto, Canada (No. 31,671), for enameled magnet wire.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

## Copper Consumption Reflects Electrical Progress

NEARLY 200,000 tons of copper were consumed in electrical manufacturing during 1927. Telephones and telegraphs used another 93,000 tons. Light and power lines for transmission and distribution, together with trolley wire, called for 108,000 tons. Electrical applications of one sort or another therefore account for almost half—that is, for 397,800 tons—of the 834,500 tons consumed in this country last year. Of the electrical copper, roughly three-fourths went into power equipment and circuits, the remaining quarter into facilities for communication.



*United States produced nearly 60 per cent of world's copper*

These statements are based on the estimates published in the 1927 Year Book of the American Bureau of Metal Statistics. If we add the 4,500 tons allocated to radio receiving sets, 750 tons to steam railways electrified, with perhaps a small fraction of the 46,100 tons used in buildings, plus roughly 11,000 tons used in electrical exports, it seems clear that fully half of the consumption of the metal goes into electrical applications.

The major electrical uses for the years 1920 to 1927 are given in the accompanying table. The annual consumption for electrical manufacturing as well as that for telephones and telegraphs has trended upward, the latter more than the former.

The greatest change is in the item of light and power lines. This shows a fourfold increase from 1920 to 1926, followed by a recession in 1927. The extensive building of transmission lines and interconnections in recent years is well known. The taking on of nearly 11,000,000 new customers called for vast extensions of primary and secondary lines, with corresponding quantities of inside wiring. These movements are reflected in the statistics of copper consumption.

Meanwhile the ratio between electrical and other uses has been remarkably constant for seven years, the former never deviating far from 47 per cent of the total. Evidently electrical manufacturing and construction run parallel with other copper-using activities; totals rise and fall, but the ratio remains steady.

Because of storage, of the natural time lag between production and consumption and of the use of considerable quantities of scrap, consumption figures are not comparable, year by year, with those of production. Thus, after the war accumulation and the descent from war prices, production in the United States fell from 635,248 tons in 1920 to less than half as much, 238,420 tons, in 1921. The decrease in consumption was far less drastic. During recent years production in the United States has approximated 60 per cent of the world's output. The yearly average of prices as shown by the New York market has varied only moderately since 1921.

ESTIMATED CONSUMPTION OF COPPER IN THE UNITED STATES*
(In tons of 2,000 lb.)

| Year | Electrical Manufactures | Telephones and Telegraphs | Light and Power Lines | Trolley Wire |
|---|---|---|---|---|
| 1920 | 170,000 | 61,000 | 29,500 | 5,400 |
| 1921 | 130,000 | 54,000 | 33,000 | 5,200 |
| 1922 | 134,500 | 60,000 | 48,750 | 4,600 |
| 1923 | 178,500 | 75,000 | 85,850 | 6,250 |
| 1924 | 195,500 | 80,000 | 90,000 | 5,100 |
| 1925 | 183,500 | 90,000 | 110,000 | 6,650 |
| 1926 | 201,000 | 104,000 | 117,000 | 7,000 |
| 1927 | 196,500 | 93,000 | 103,000 | 5,300 |

# Production in Middle Atlantic States Continues High

PRODUCTIVE operations of the manufacturing plants in the Middle Atlantic States continued on a high plane during May, according to basic data received on electrical energy consumption by about 400 large manufacturing plants operating in the section. Ever since last November the operations of the manufacturing plants in this section have been above those for the same month in the year previous, the peak of activities being reached in February, during which month the rate of operations was about 12.5 per cent above February, 1927. In May the rate of operations was about 1.6 per cent above April and 4.6 per cent above May last year.

During May seven of the section's primary industries—automobiles, chemicals and allied products, food and kindred products, leather and its products, ferrous and non-ferrous metal-working plants, rolling mills and steel plants, and textiles—witnessed productive activities materially over those reported for May, 1927. On the other hand, three industrial groups—lumber and its products, paper and pulp, and the stone, clay and glass group—reported rates of operations under those of last year.

*Indexes of Productive Activity in the Middle Atlantic States*

All Figures Adjusted for Number of Working Days

| | May, 1928 | April, 1928 | May, 1927 | Average First Five Months 1928 | Average First Five Months 1927 |
|---|---|---|---|---|---|
| All industries | 113.8 | 112.0 | 108.8 | 116.5 | 110.1 |
| Automobile | 169.6 | 171.2 | 121.6 | 167.0 | 103.9 |
| Chemical and allied products | 135.6 | 133.4 | 109.3 | 131.9 | 103.6 |
| Food and kindred products | 100.8 | 92.4 | 90.4 | 96.9 | ..... |
| Leather and its products | 110.0 | 120.9 | 105.8 | 117.9 | 116.7 |
| Lumber and its products | 104.8 | 104.5 | 159.5 | 106.4 | ..... |
| Metals group | 109.8 | 109.1 | 106.6 | 112.5 | 109.9 |
| Rolling mills and steel plants | 111.6 | 108.4 | 106.6 | 113.8 | 109.9 |
| Metal fabricating plants (ferrous and non-ferrous) | 108.0 | 109.9 | ..... | 111.3 | ..... |
| Paper and pulp | 123.8 | 112.5 | 129.5 | 116.1 | 126.9 |
| Stone, clay and glass | 112.6 | 124.3 | 120.4 | 115.1 | ..... |
| Textiles | 106.7 | 104.0 | 105.3 | 114.9 | 110.8 |

## *Dramatizing a Convention*

WITH a program dramatized and animated throughout the Pacific Coast Electrical Association staged at Pasadena, Calif., last week one of the most successful conventions in its twelve years of existence. Routine matters had been handled during the year, leaving the time of the convention for consideration of new subjects with little time wasted on rehashing of old problems.

Innovations were many. Recognizing that men are becoming more and more "eye-minded," most of the subjects presented were animated by the use of pictures, slides, graphs, charts, apparatus, playlets and pantomime. Dramatization aided in brightening many topics usually found dry, and long sessions were interspersed with music. President-elect Arkwright of the parent body, who had traveled across the United States to attend the convention, spoke most enthusiastically of the whole program arrangement and said that as a result of what he had seen he would make a change in his preliminary plans for the national convention of 1929 and would adopt many of the features of the California assemblage. President W. L. Frost of the Pacific Coast Electrical Association and those who assisted him in arranging the program are to be complimented upon the outstanding success scored at Pasadena.

## *—— and Into the Fire*

THE annual release of thousands of youngsters from their preparatory years of college life and their assimilation by industry and the world of reality is again at hand. The traditional college man is as rare an individual as the typical business man, for, like all "types," accepted characterizations approach calumny. The recent graduate is eager, ambitious, energetic, overconfident and, in general, exceedingly impatient of delayed recognition of his unproved talents. Such qualities are not those at which one may justly scoff. The somewhat gleeful initiation of the newcomer by the employer into the much overrated school of hard knocks is a doubtfully judicious appreciation of the high, if immature, qualities of youth.

Electric light and power companies have evolved several methods for the training and development of young engineers, but any plan which fails to keep the youngster's time fully employed—which fails to allow an outlet of activity for his energy and desire to do—is an exceedingly poor one. Idle hours and no assigned duties are destructive in the extreme, especially to men fresh from recent intensive mental activities. Responsibility cannot be thrown on untried shoulders, older employees cannot be sidetracked for youth; but a training plan without full-time use of the employee's services and without a job for him at the termination of the development period is unforgivable if he has proved himself.

As for the young man, W. E. Mitchell, vice-president of the Georgia Power Company, whose avowed hobby is that of making human beings out of engineers, recently said: "Broaden your field; lift your eyes; prepare for opportunities; eat up all the responsibilities in sight."

* * * *

## *Hoover Becomes the Republican Standard Bearer*

HERBERT HOOVER was nominated by the Republicans last week at Kansas City as their candidate for President of the United States. That this honor came to Mr. Hoover because he is an engineer is unlikely, he is more than that and his reputation is predicated on his humanitarian as much as on his engineering accomplishments. Nevertheless, it is not too much to claim that it was his training as an engineer which gave him analytical ability and enabled him to handle the weighty matters of feeding Europe and organizing relief expeditions in the Mississippi Valley and elsewhere as engineering problems. His nomination, therefore, is a tribute to engineering training, because any one who has ever heard Mr. Hoover knows that, like Calvin Coolidge, he possesses neither personal magnetism nor the gift of oratory. But —and his management of the Department of Commerce proves it—Mr. Hoover knows how to co-ordinate economics and science with the business of the country as well as with the business of government to the advantage of both.

Moreover, and without any show of partisanship, the business of the country and the aspirations of its citizens will be peculiarly safeguarded by a man with Mr. Hoover's passion for aggressive effort under private initiative. He has on numerous occasions delivered himself on this subject. "Our economic system," he said, "has grown up out of the magnificent effort of individuals. We have grown in efficiency in our individual businesses and in our individual concerns beyond that of any other country in the world." Speaking of government operation, he has declared: "Some faint odors of socialism are still about our country. Some groups would have the federal government undertake the operation of public utilities; some groups would have these operations undertaken by the individual states. The Republican party holds to the protection of public interest by regulation of private enterprise in public utilities—it does not believe in the deadening hand of operation by government bureaucracy."

Such is the man whom the Republican party presents to the people as its standard bearer. To the engineering fraternity, and especially to the electric light and power industry, Herbert Hoover is no stranger. They know his ability, and he is conversant with their accomplishments. Mutual admiration and respect exist, and did the decision rest with the engineers of the country, Mr. Hoover would be elected by acclamation. No greater tribute could be paid to any man.

## *Beauty Versus Utility*

ON THREE widely separated river sites offering enticing possibilities for the generation of hydro-electric power the old question of whether esthetic or economic considerations should come first is once more to the fore. These sites are the Great Falls of the Potomac, the Cumberland Falls in Kentucky and the Royal Gorge of the Arkansas River in Colorado.

In the first case a well-backed company stands ready to develop the site as part of a comprehensive scheme designed to furnish Washington, and perhaps Baltimore, with additional energy; in the second case very powerful utility interests already own the site and await only permission from the Federal Power Commission to put to use the power now "running to waste"; in the third case the leading utility company of Colorado has applications before the state and federal commissions for authority to do likewise. Congress has taken a hand in the Potomac situation and forbidden the national power board to do anything without its approval. Vigorous opposition is also waged by those interested in park development around the capital, as well as by companies antagonistic to the plans of the applicant. Opposition from scenery preservationists has prevented action on the Cumberland project, and the same thing is true so far as to the Royal Gorge, though an early decision from the state body is expected.

It is gratifying that there seems no present disposition on the part of any of the light and power companies concerned to try to ride roughshod over the protesters. On the contrary, a disposition to let the latter's arguments carry their full weight and receive unhurried and meticulous consideration by the authorities in control, and then to abide uncomplainingly by the decision reached, seems manifest. This is as it should be. Any belittlement of views taken by sincere lovers of natural beauty would be unworthy of an industry whose loudly professed desire to serve surely includes among its objects man's higher needs where these are affected as well as his material welfare.

The controversy in each of the three cases has two aspects, just as have had the similar disputes over Niagara Falls and other water-power sites in the past. There is first the argument over whether what the electric companies desire to do would really injure the scenery. There is second the argument already stated over how far an esthetic pleasure which can be enjoyed only by a comparatively few who live near or have the chance to visit the site in question should outweigh a practical benefit to many. Every case that comes up must, of course, be settled on its individual merits. No two are just alike. And when landscape experts, engineers, economists, poets and plain citizens dispute and wrangle, not only with those of opposing views but among their respective selves, any editorial attempt to deliver judgment from the cathedral in a specific case might be as presumptuous as ill advised. Perhaps, none the less, a few general principles may be commended for the consideration of litigants and judges both. We should phrase them somewhat as follows:

First, no natural beauty should ever be harmed or even altered in aspect against general protest in the state immediately concerned. Second, even where the opposition is weak, no hydro-electric exploitation of such sites should take place without convincing proof of its economic necessity and of the public benefit resulting therefrom. Third, when the total horsepower involved is small, and the saving consequently insignificant, the stream had better be left alone to dash among its stones and over its declivities as nature taught it. Are waterfalls, after all, mere waste products of elemental forces? "The beautiful," says Victor Hugo, "is as useful as the useful—in fact, more so."

* * * *

## *Exports Depend on More than Goods*

HOWARD A. LEWIS, whose article on the electrical market in Brazil appears elsewhere in this issue, strikes a keynote as to the development of our export markets when he insists that America must send ideas and sympathy, as well as dollars and enthusiasm, management and engineering skill, to help build and develop the market in which we share. Back of the development of every export market must lie a plan, and the fundamentals of that plan should embody a development of the country involved. This plan should include not only goods and money but ideas and people who will settle there and add their lives and work to the wealth of the nation. Other European nations, and Germany in particular, have followed this plan and have thus entrenched themselves solidly in some countries. The opportunity awaits the American manufacturer in continents like South America and Africa where unexploited markets yet exist.

* * * *

## *Good Work Accomplished by the Bay State Commission*

LAST week the Massachusetts Department of Public Utilities issued a decision of no little importance and value in regard to residence rates on the Boston Edison system. In a comprehensive order the board established the principle of the company's area-energy rate as sound, extended it to cover the entire residential service supplied by this utility (excluding hotels and apartments where bills are not rendered by the company to individual tenants), and determined that at present a zone system of rates presents too many difficulties to be justified in the metropolitan and suburban area served by this leading central-station property of New England. The effect of this finding will undoubtedly be to stabilize the rate situation in the Bay State and so to improve the relations between the operating companies and the commission. These relations have been a bit strained of late in view of the pending issues between the Worcester company, the Cambridge company and the board, and it is very gratifying to record such an approval of a form of rate which President Edgar of the Edison company has well characterized as a solution of the residence-rate problem.

The commission modified the terms of the company's so-called "B" rate to an extent which cuts the company's income a million dollars a year, but this is not expected to interfere with either the dividends or the depreciation charges on this property. The limitations hitherto restricting this rate are withdrawn and the entire residential group of customers will now enjoy the benefits of the inducement-rate principle. The result will, of course, be to encourage the more liberal use of electricity for all home purposes, and it is to be expected that in due course there will be a substantial increase in the total revenue per residential customer along with a much larger use of service per dollar expended. That is, the company should be able to increase its income from this class of business in the not distant future as these customers take advantage of the opportunities to receive more for their money than ever before.

Under these conditions the prospects of future peace in regard to domestic rates on this system appear exceedingly bright, and as the practice and experience of the Boston Edison company are very closely studied by other New England utilities, the lessons of this decision are not likely to be overlooked in other quarters. Among the collateral comments of the commission in this finding it is a pleasure to note that the board sets its face against the general practice of a regulative body's undertaking to establish the entire rate structure of a company except under unusual circumstances, recognizing that this is a matter which falls largely within the field of management. We are not sure that some of our friends among the allocation experts will concede that the difficulties of establishing a zone system are as great as the commission implies, but, be that as it may, it is reasonable to expect that the continuance of uniform residential service rates throughout the many hundreds of square miles served by the Boston company will be very acceptable to the public and not unwelcome to the company. Both the commission and the company are to be congratulated upon this decision.

## *Radio Trade Show Raises a Question*

CENTRAL-STATION men who visited the Radio Trade Show in Chicago last week carried away some definite impressions. First was the size of the outpouring—there were 205 exhibitors and 21,000 registrations—dealers, wholesalers and manufacturers and their men. Second were the three current trends in radio so conspicuous in the show—the growing popularity and pre-eminence of the dynamic type of reproducer, the rapid drift toward the combination of radio and the phonograph in a single cabinet, and the growing importance of furniture to the radio merchant. Each of these trends has a distinct significance to the power-company sales department.

The coming of the dynamic "speaker" is just one more evidence that the art of radio is young and that we may expect fundamental development to continue and bring with it both hazard and opportunity to the retailer. But the alliance between radio and the phonograph housed in expensive furniture that is the finest expression of the cabinetmaker's art is fast changing the whole merchandising aspect of the line. Radio in the past has been an electrical device. It is now taking on the aspect of a musical instrument that is to be sold as such. This transformation will undoubtedly bring a large measure of prosperity to the dealer, but it will call for a higher type of merchandising.

The power company is certainly interested now more than ever in the sale of radio goods. For by the marriage of radio and the phonograph the phonograph also becomes electrical in its amplification as well as its motive power. But fine furniture will be a moving influence in radio sales. Is the power company ready and competent to do a good job in marketing this *de luxe* line? This question deserves the very serious consideration of the industry.

* * * *

## *Some Impressions of the N.E.M.A. Convention*

ANY organization faces a test of its confidence and stability at the end of its initial administration when the man who has had the helm from the beginning steps back and turns over the ship to another steersman. So it was last week with the National Electrical Manufacturers' Association, gathered at Hot Springs, Va., for its second annual convention. It was a year ago that the apparatus, supply and radio manufacturers met together for the first time as one organization. A policies division and an appliance division have since been added, and these five divisions now comprise forty-five sections, each concerned with its own product problems. The association as a whole has naturally been finding itself and groping its way forward toward full industry consciousness and industry purpose. Under the strong leadership of Gerard Swope, it has gained strength and prospered. The year's record is a good one. And it is particularly fortunate that Mr. Swope is to be succeeded in the presidency by another strong man. H. B. Crouse, who heads the incoming administration, is one of the elder statesmen of the electrical manufacturing industry and one from whom much may be expected.

The wisdom of combining the various associations of electrical manufacturers into one industry group is clearly demonstrating itself, particularly in the fields of apparatus and supplies, where much progress has been made both in standards and in policy. It is to be hoped that the small separate groups of appliance manufacturers—the cleaner, clothes washer, ironer and refrigerator associations—may some day join the range, heating, appliance and fan sections in the N.E.M.A. and gain the benefits of unity. Some solution also should be found of the problem presented by the divided leadership in the radio industry, with its rival organizations; but whether or not it is to be found in the N.E.M.A. is, of course, a matter for the radio industry itself to decide.

The record of the year shows that much productive work has been done. Tariff rulings, labor legislation, insurance, codes and ordinances all offer common problems which call for co-operative action on the part of the entire electrical family. In the solution of these problems the association has already won a prominent place in industry councils. Moreover, among the manufacturers friendly personal contacts have worked for forbearance, trust and co-ordination, and there was a spirit of harmony in this meeting that has been sometimes wanting in the past.

President Crouse takes over a going concern that is already contributing substantially to the promotion of industry statistics, standards and improved trade practices and policies. The better feeling that today exists among these many competing manufacturers has grown largely out of the N.E.M.A. and provides a groundwork from which further good fruit should come in the year ahead.

# *Norway Leads in Hydro-Electric Development*

*Skjaeggedalsfoss, Hardanger*

*Vemork power plant, Rjukan*

THE great water-power resources of Norway were early appreciated by the engineers of that country and utilization has been consistently undertaken.

There are 35 falls of more than 50,000 hp. The consumption of electrical energy exceeds 3,000 kw.-hr. per capita per year.

*Vettisfoss, Sogn*

# Dielectric Data on "Pyrex"

### Tests of material over wide range of frequency and temperature establish a standard of comparison for dielectrics exhibiting ionization and hysteresis lag

By C. L. Dawes and P. H. Humphries
*Harvard University, Cambridge, Mass.*

In connection with dielectric investigations at the Harvard Engineering School it became necessary to know the dielectric properties of slabs of glass over wide ranges of power frequencies and temperature. Preliminary investigations with ordinary plate glass demonstrated that the losses in this type of glass vary so much with temperature that its use for this purpose is undesirable. About this time data published in the Electrical World[1] showed that the power factor and capacitance of "Pyrex" remained much more nearly constant with change of temperature than with commercial glasses. Hence a piece of "Pyrex" 8 in. (20.3 cm.) square was obtained from the manufacturers. This glass is designated as "Pyrex A" and is a chemical ware glass. It is not the low-power factor, low-dielectric constant "Pyrex" which is supplied for radio and other electrical purposes.

## Preparation and Method of Testing Glass

Both surfaces of the glass were accurately ground so that they were plane and parallel and the thickness was 0.556 in. (1.411 cm.). Then both surfaces were carefully silvered and a ring of radial thickness $\frac{1}{16}$ in. (1.6 mm.) and having an inside diameter of 4.69 in. (11.9 cm.) was cut through the silver. This gave a test electrode of 17.26 sq.in. (111.3 sq.cm.) area and the guard ring (Fig. 1).

The glass was tested in a high-voltage bridge,[2] the connections of which are shown in Fig. 1; $C_1$ is a high-voltage air condenser whose capacitance is of the order of 120 micro-mfd.; $R_1$ is the series resistance in this arm of the bridge; $R_3$ is a resistance which brings the shielding of the air condenser and vibration galvanometer $G$ to the same potential as the low-voltage plate of the air condenser; $C_2$ is the test specimen; the primary of the mutual inductance $M$ and $R_2$ are in series with it to form the other arm of the bridge; $R_4$ is adjusted to bring the shielding about the low-voltage electrode of $C_2$ to the same potential as this electrode. Bringing the shieldings to the same potentials as the electrodes which they shield eliminates errors due to shunted capacitances across resistances $R_1$ and $R_2$. Without these precautions errors from this cause may be large.

The curves Figs. 2 to 7 were taken at constant potential, 5,000 volts or 9 volts per mil (3.54 volts per millimeter). It was found that up to 5,000 volts and more the voltage had no effect on the power factor and capacitance.

Fig. 2 gives the curves of per cent power-factor as functions of frequency taken at various temperatures from 14 deg. C. to 71 deg. C. These curves are characteristic of good dielectrics. The power factor ordinarily does decrease in this manner with increase of frequency. Also the power factor should increase with temperature.

The watts loss per cubic centimeter as a function of frequency, taken at various temperatures, are given in Fig. 3. These curves are practically straight lines having positive slopes, but which do not go through the origin. The equation for each temperature is given by

$$P = mf + P_o$$

where $P$ is the watts per cubic centimeter, $m$ is the slope, $f$ is the frequency and $P_o$ is the power at zero frequency; that is, $P_o$ gives the intercept of each curve on the $P$ axis.

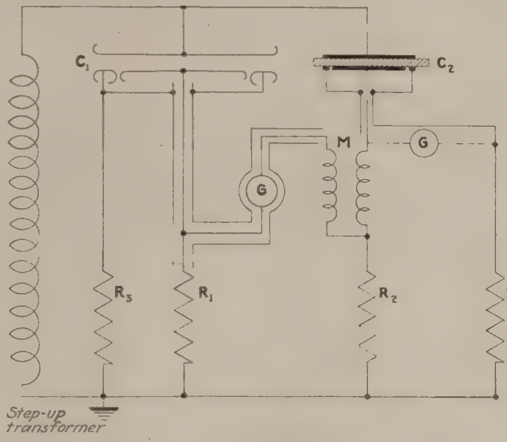

*Fig. 1—Connections of high-frequency bridge*

If the values of $P_o$ be determined and plotted as functions of temperature the curve shown in Fig. 4 is obtained. This curve is identical in shape with a curve giving the direct-current loss in a dielectric as a function of temperature, when the voltage is fixed. The authors would like to have verified this curve by direct-current measurements. Although we have extremely sensitive apparatus for making such measurements, a sample as small as this one is far beyond even its range of sensitivity. We feel, however, that this relationship is significant, and we hope to verify it further with other experiments which we are making with dielectrics. It also appears that the increase of dielectric loss over zero fre-

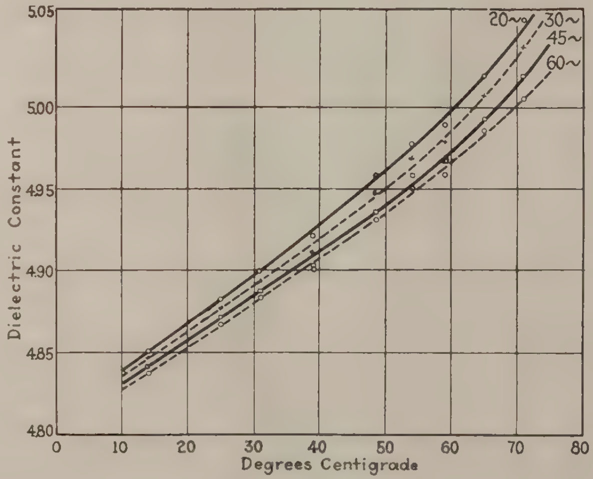


*Figs. 2 to 8—Results of tests at constant potential (9 volts per mil)*

quency loss is proportional to the frequency. Since "Pyrex" is admittedly an excellent dielectric, we feel that this may be one criterion of an excellent dielectric.

The curves of dielectric constant as a function of frequency, taken at various temperatures, are given in Fig. 5. These curves show that the dielectric constant decreases with increase of frequency and that the dielectric constant increases with temperature. These relationships are common with dielectrics.

Variation of power factor with temperature at frequencies of 20, 30, 45 and 60 cycles per second is shown in Fig. 6; Fig. 7 shows the variation of watts per cubic centimeter with temperature for these same four frequencies; Fig. 8 gives the variation of dielectric constant with temperature also for these same four frequencies.

The foregoing characteristics are important, both from the scientific and practical points of view. They show, over wide ranges of frequency and temperature, the characteristics of a solid dielectric in which there is no ionization and apparently no hysteresis lag. They can very well, therefore, serve as a standard of comparison for the less perfect dielectrics such as cable insulation. They show that with this type of glass the total power loss is not proportional to frequency, but that the increase of loss over that at zero frequency is proportional to frequency.

# The Right to Defense

By R. F. Pack
*Vice-President and General Manager*
*Northern States Power Company*

*R. F. Pack*

THE "revelations" and "disclosures" which have so far appeared in print as a result of the Federal Trade Commission's investigation of the electric industry boil down to the simple fact that the industry is using established methods of publicity and education for presenting its case to the public.

The methods used deviate in no essential manner from those repeatedly and successfully employed by other industries, by state and municipal agencies, by political associations and even by those who are objecting violently to such activity by the utilities. A joint committee is formed to insure united action and support. Competent counsel are employed to direct the work and able writers secured to put the facts and arguments into effective form. Naturally funds are required to carry out the program and are supplied equitably by various units of the industry.

What is illegal about any of this? The motive is self-preservation, a more united defense against bitter and mostly unjust attacks on an entire industry. There has been no secrecy concerning any portion of this defense. The industry stands back of and is ready to prove any statement of fact or argument it makes in its behalf. The fact that it has contributed something toward legitimate and valuable research generally, as well as in schools and colleges, and has invited investigation and study of its business by qualified observers, is evidence of the confidence felt in its basic soundness.

Does not the industry have the right to present its side of the case to the public, either through the press or otherwise, particularly when faced with unfair propaganda, charging unreasonably high rates and poor service, where no just ground for such charges exists, and urging municipal or government ownership and operation of the plants in face of facts which conclusively show such operation to be contrary to the best public policy, and when, further, the soundness of well-protected securities is attacked, the fairness and competency of the business organization and management questioned, without supporting evidence? Apparently not, in the opinion of their critics in Washington and elsewhere. From their viewpoint the utilities, together with all incorporated undertakings, should be muzzled and remain mute, while the interests of those who, through the supply of funds, have made much-needed enterprises possible are attacked for selfish reasons by political forces and radical organizations which evidently regard free speech as a special privilege of their own.

One is almost tempted to believe that the politician and the radical are driven to such a demand as this by lack of campaign material that will stand the test of close scrutiny. Utility commissions, for instance, are now keeping the rate levels of the utilities so low and the standards of their service so high that complaints against unreasonably high rates and inadequate service can now seldom be sustained in fact. This is a matter of record. The records further show that in practically all cases investigated the cost of producing and furnishing the service is much higher under municipal ownership and operation than under private ownership and operation. This is even true when no allowance is made for the fact that municipal plants pay no taxes, while the local, state and federal taxes paid by the privately owned utilities and by the owners of their securities amount in some cases to as much as 15 per cent on their gross earnings. When taxes of all kinds are considered, therefore, the rates should be about 15 per cent lower for municipal than for privately owned utilities. Instead, the average rate is, as a rule, higher for the former and the service poorer. Such facts are not pleasant to those who expect to find votes in bad public utility conditions. It would be better for them if the truth could be suppressed.

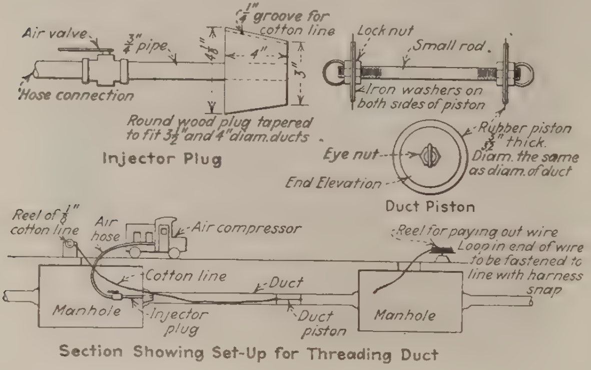
The management of the utilities believe that it is their duty to defend, by lawful means, both their business and the investors therein, and are not ashamed of the methods employed to that end. In fact, close scrutiny of both will show that those employed by the utilities will compare very favorably with those employed by their critics. No other industry has accomplished more for the benefit of the public than the public utility industry, nor will it be easy to find one with a cleaner record all around. It is difficult to see how its practices could be bad, for the form of its accounts are prescribed and audited, its rates and standard of service fixed and the security issues effectively regulated by utility commissions.

# Threading Conduit

By R. L. Dodd

*General Foreman Underground Division, Milwaukee Electric Railway & Light Company, Milwaukee, Wis.*

The problem of threading a line from one manhole or pull box to another through a conduit so that a cable may be pulled through it is one that has had many solutions in the past and will have more in the future. From the apocryphal use of ferrets and trained rats with strings tied to their necks to the very matter-of-fact and laborious employment of rod sections the solutions have spread through the range of human ingenuity. One method that has had considerable success and which is now in use on the system of the Milwaukee Electric Railway & Light Company uses compressed air.



Air valve
$\frac{3}{4}$" pipe
$\frac{1}{4}$" groove for cotton line
$4\frac{1}{8}$"
4"
3"

Manhole
Injector plug
Duct piston
Manhole
Section Showing Set-Up for Threading Duct

*Duct threading with compressed air and special parts used*

An air compressor, mounted on a truck, furnishes the power. The air hose is connected to the duct by means of a tapered wooden plug which has a hole bored lengthwise through it and which has a small grooved channel on its surface so that the $\frac{1}{8}$-in. cotton lead line may be drawn into the duct. The piston, or carrier, to which the end of the small line is attached consists, as is shown in the drawing, of a pair of rubber disks clamped between smaller iron washers in the ends of a short piece of iron rod. The piston with the line attached is placed in the duct, the injector plug inserted and the air is turned on. Then if all of the attending circumstances are propitious, the piston moves forward at a speed of about 10 ft. per second and drops into the next manhole in a very short time.

When the piston comes through a wire is pulled in and left for the cable crew, which follows the wiring crew a few days later. The process is repeated for each duct to be wired and the compressor moved along the line to every second manhole. Each set-up serves for ducts in two or more directions. Experience of four years with this apparatus indicates that the method is economical and fast for jobs involving two or more ducts and for crooked lines which would otherwise necessitate frequent uncoupling and recoupling of jointed rods.

This method of duct threading, one might say, has the advantages of its disadvantages. By this is meant that if the piston goes through the duct as it should one can be sure that the line is straight and that the duct is clean and in good condition. If there are any large pieces of rubble in the conduit the piston will either drive them before it or will be stopped. If the duct is broken and offset by injury after installation the piston will not pass. From these considerations it is apparent that the passage of the piston through it is almost a guarantee of the good condition of the duct. There are possibilities that the piston may run into a bad condition somewhere in the duct and become jammed. If it cannot be drawn out by the lead line it can usually be freed by rodding.

Four-inch duct runs up to 500 ft. long may be economically threaded and wired by thus substituting compressed air largely for manual labor in tight conduits, such as those of metal or fiber. Conduits of porous material or those having leaky joints permit the escape of the air and limit the distances.

# Computing Compensator Settings for Voltage Regulators

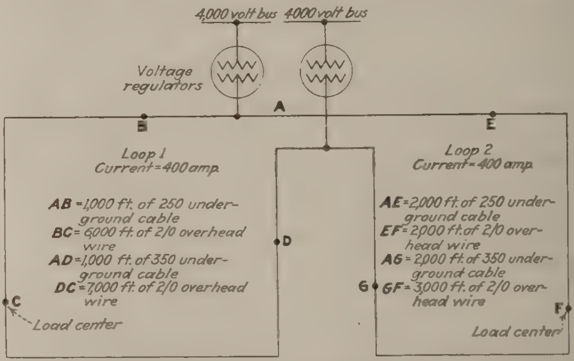
THIRD ARTICLE

By V. W. Palen

Double loop circuits.—The compensator settings for the single feed and the single loop, discussed in the previous articles, require no unusual tactics. Computations are relatively simple. In the case of the double loop things become a bit more involved. If it is assumed that the circuit shown in the accompanying illustration has been split into two individual loops and that the computations have proceeded in a manner similar to the case of the single loop, which was discussed previously, the results so far would be something like this:

*Loop 1* Resistance drop (*AC*) = 5.50 volts
Reactance drop (*AC*) = 8.90 volts
Impedance drop (*AC*) = 12.10 volts
*Loop 2* Resistance drop (*AF*) = 2.70 volts
Reactance drop (*AF*) = 3.94 volts
Impedance drop (*AF*) = 4.82 volts

A slight difficulty arises where two circuits or loops are cross-connected as in this instance, for it is evident that each regulator regulates for half of each loop. Where the impedance of one loop is greater than the impedance of the other, for which load center shall the compensator be adjusted? It has been the successful practice of one company to average the values obtained for the two loops and to set the compensator on each regulator for this average value. In this instance the settings would be:



4,000 volt bus
4000 volt bus
Voltage regulators
A
B
E
Loop 1
Current=400 amp.
Loop 2
Current=400 amp.
AB=1,000 ft. of 250 underground cable
BC=6000 ft. of 2/0 overhead wire
AD=1,000 ft. of 350 underground cable
DC=7,000 ft. of 2/0 overhead wire
D
AE=2,000 ft. of 250 underground cable
EF=2,000 ft. of 2/0 overhead wire
AG=2,000 ft. of 350 underground cable
GF=3,000 ft. of 2/0 overhead wire
G
C
F
Load center
Load center

*Double loop circuit for illustrating calculations*

$IR =$ (average of 5.50 and 2.70) $= 4.10$
$IX =$ (average of 8.90 and 3.94) $= 6.42$
$IZ =$ (average of 12.10 and 4.82) $= 8.46$

The computations for the triple loop circuit will appear in the next article of the series.

# Hydro Industry in Norway

Pioneer in legal and construction elements. Nearly 2,000,000 hp. developed for industry and public service. Details of development and basic statistics

By George Smedal, Jr.

*Transmission line from Rjukan to Oslo*

THERE is no country in the world where the development of the hydro-electric industry has been so consistent as in the little Scandinavian kingdom of Norway. According to the latest procurable figures, this nation, with a population of only 2,650,000 in 1920, a smaller population than Wisconsin or Georgia, has plants which develop 1,910,000 hp.

The beginning of water power works in Norway, the ancient quern wheels, dates back to the beginning of the nation's history. In 1530 the first water saws were built and, by royal patent, dated Aug. 15, 1616, the privilege of erecting and working such saws was confined to owners of alodial estate. This restriction is generally considered the basis for the present law relating to water courses in Norway. Originally, all water rights belonged to the ground over which the water flowed. This act was particularly definite. If the two banks of the water course happened to be under different ownership, the water rights belonged to both riparian proprietors, each of whom owned one-half, the boundary being drawn along the deepest part of the river.

In modern times most of the best water rights have been separated from the landed property and consolidated in the hands of private persons, combinations of private persons, industrial companies, or to state or local authorities.

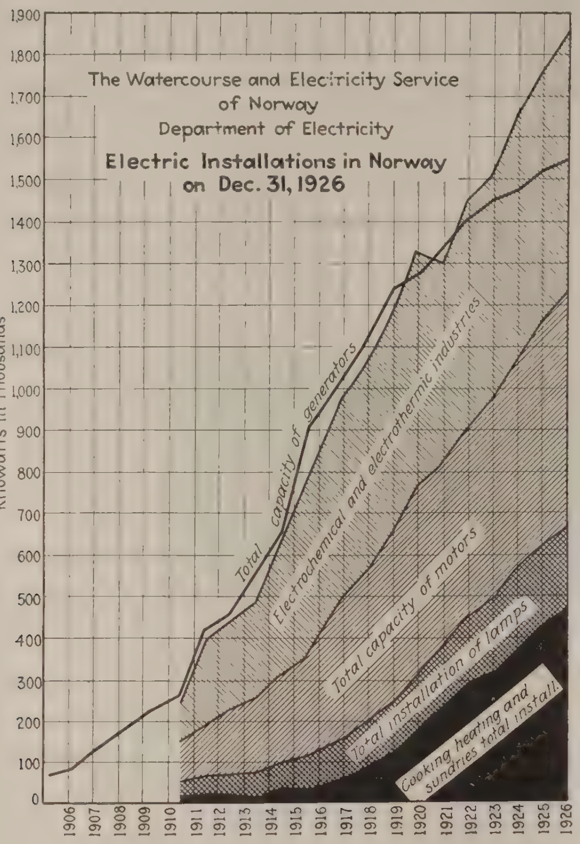
The experience and subsequent action by Norway in the control of this great resource have been the basis for similar legislation in many other countries. Especially is this true in regard to foreign ownership of power rights and sites. Until 1888 foreigners could acquire real property in Norway. In that year the act relating to Norwegian citizenship was passed. This provided that foreigners could not purchase real property or hold property in "usufruct" except by special sanction of the crown. The use of waterways in Norway is governed by the act of July 1, 1887, with subsequent supplemental measures, while the acts of Dec. 14, 1917, and May 21, 1921, apply to the regulation of water courses and the purchase of waterfalls.

The beginning of industrial exploitation of water power in Norway dates back to 1845, when textile manufacturers undertook its development, and progressed rapidly after the '70s, when the first mechanical pulp mills were established. Figures for 1880 reveal that a total of 30,000 hp. was developed. It was not until 1889, however, that the first hydro-electric works were erected in Hammerfest and Skien. At that period approximately 60,000 hp. was developed. The subsequent growth of the electrification of waterfalls is best shown by the accompanying table.

TABLE I—GROWTH AND USE OF NORWEGIAN WATER POWER

| Application | 1900 Hp. | 1907 Hp. | 1913 Hp. | 1922 Hp. | 1926 Hp. |
|---|---|---|---|---|---|
| Wood manufacturers.......... | 90,000 | 117,000 | 180,000 | 220,000 | 230,000 |
| Electricity supply............ | 8,000 | 31,000 | 125,000 | 570,000 | 690,000 |
| Electrochemical and electrometallurgical industry...... | 10,000 | 48,000 | 390,000 | 770,000 | 840,000 |
| Other industries............. | 36,000 | 42,000 | 60,000 | 140,000 | 150,000 |
| Total..................... | 144,000 | 238,000 | 755,000 | 1,700,000 | 1,910,000 |

According to 1922 government statistics the exploitable water power in Norway was estimated at 12,300,000 hp. This figure, however, is by no means final. S. Kloumann, director of the Norsk Aluminum Company, Hoyanger, Sogn, Norway, has placed the exploitable water power at between 16,000,000 and 18,000,000 hp. This is the figure he gave at the World Power Conference in London three years ago. It must also be borne in mind that there is no standard practice in estimating power resources and their distribution. Some nations state their volume of power on the basis of the estimated mean flow in the rivers, regardless of whether or not the possibilities of regulation are existent; in other cases the volumes of power returned are based upon the calculated regulated flow in the six or nine months when the rivers are at their highest level, and other figures again give the exploitable water power at the nine months' efficient, plus 40 per cent. In respect to Norwegian water power, the returns published here represent power which is disposable over the twelve months of the year in those years when conditions are least favorable and which permits economic exploitation. The 16,000,000 to 18,000,000 hp. as indicated, therefore, represents the least number of horsepower available in Norway for manufacturing industries, handicrafts, public requirements and agriculture which may be obtained from water-power resources within the kingdom.



*Electric installations in Norway as of Dec.* 31, 1926

### THE ALLOCATION OF DISTRIBUTION

When there is any question of the distribution of Norway's vast resources of water power between public requirements and those of large-scale industries, it is generally agreed that the former should enjoy the preference. How great public requirement will be in the future is a matter of conjecture which cannot now be accurately estimated. It appears, however, that these requirements have been practically met for the present. The great power projects in the north and west are favorably situated for large-scale industries. Considerable volumes of power suitable for industrial purposes exist also in the south, but they are somewhat more costly than that in the west. It may, perhaps, be of interest to set down the more important falls suited to large-scale industrial development. The water courses mentioned, according to their geographical position, are from north to south along the west coast, where harbors are free from ice all year. The accompanying list includes only such water courses as are capable of yielding, when developed, 30,000 hp. or more, and consequently do not include all resources ultimately capable of economic utilization and development.

The tabulations in Table II and Table III comprise approximately 4,200,000 hp., or about 30 per cent of the water power that is economically exploitable, and this volume may be characterized as the minimum that, in any circumstances, can be placed at the disposal of large-scale industries.

Norberg Schulz, electricity director Central Board of Norwegian Water Courses and Electricity Commission, declared that the exploitable water power in Norway is estimated at 12,500,000 turbine horsepower, or approximately 10,000,000 kw. at low flow. In this summation are not included falls of less than 10,000 turbine horsepower or falls that can be harnessed only at an exceptionally high cost. With a population of 2,700,000 Norway has, therefore, about 30,000 kw.-hr. electric energy per inhabitant per year.

The water power is spread throughout practically the whole country; the water courses are, as a rule, easy to regulate, and the extensive mountain wastes offer rich possibilities of water storage. In many Norwegian waterways there exists considerable concentration of great volumes of power, including 35 falls of more than

50,000 hp. Approximately 60 per cent of all the water power in the country occurs in falls that are 300 m. high or more.

### Volume of Power Developed

The accompanying chart shows from the graphic curve that the volume of power developed in Norway, Dec. 31, 1925, was 1,525,147 kw., equivalent to about 15 per cent of the aggregate water power in the country. There thus remains about 10,000,000 turbine horsepower of unharnessed power in Norway, and of this something like 4,800,000 turbine horsepower, taking into consideration only falls exceeding 10,000 turbine horsepower, is lying so near the coast that the cost of transmission to ice-free harbors will not make any material difference in the cost of the power.

The graphic curve also gives a picture of the rate at which the development of water power proceeded from 1906 to the end of 1925. The curve, in addition, shows that this work made very rapid strides, particularly from 1910, with the result that Norway has become the world's largest producer of electric energy in proportion to the size of the country and population. According to the returns available the production of electric energy in Norway Dec. 31, 1925, was:

| | Total Millions, Kw.-Hr. | Per Inhabitant, Kw.-Hr |
|---|---|---|
| Public service | 1,800 | 700 |
| Large-scale industry | 6,200 | 2,300 |
| Totals | 8,000 | 3,000 |

At the end of 1925 production was thus in the neighborhood of 3,000 kw.-hr. per head of the population. Seventy-seven and a half per cent of the total output of energy in the country was used at that time for large-scale industrial purposes. Wood manufacturers are the largest consumers of electricity in Norway, and in the expansion of this industry water power, employed both direct and converted into electric energy, has played an important rôle. Another industry using the abundant supply of cheap electric energy in large quantity is that engaged in the production of nitrate of lime, which is now consuming something like 250,000 kw. of electric energy. For the manufacture of carbide, cyanamide, aluminum, zinc, ferro-alloys and so on, there has so far been developed between 300,000 and 400,000 kw.

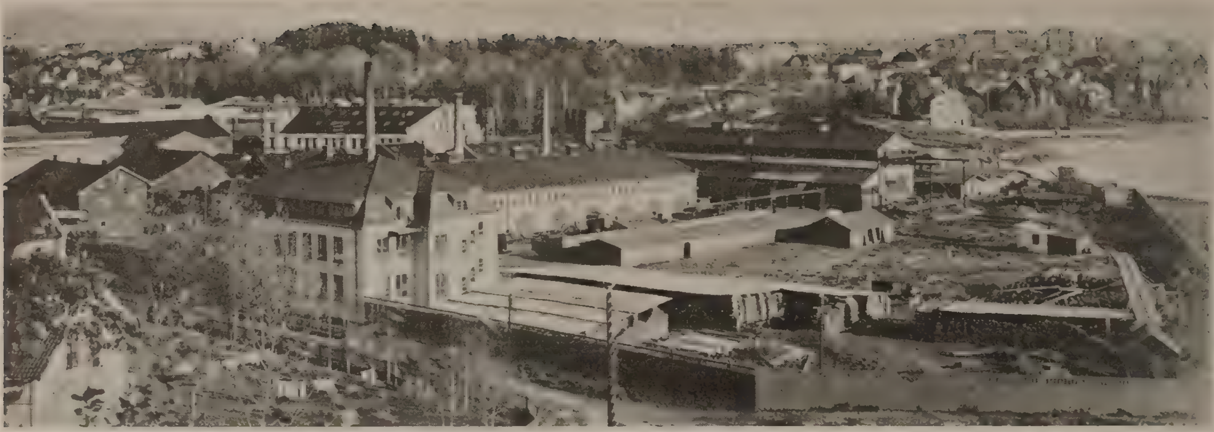
The diagram reveals that the electric supply for public service has undergone quite a rapid growth also, and bears comparison to the increase in use of energy for industrial purposes. Whereas the first electricity works constructed in Norway were for private account, and, in a majority of cases, for industrial enterprises, the public services supply has in the last ten or fifteen years become primarily a municipal business, which was at first conducted by the separate local authorities and latterly by large intermunicipal and county-municipal combines.

The extent of the areas of supply and the number of inhabitants are determined by geographical conditions. The inhabited districts of Norway occupy only 25 per cent of the total area of the country, and the population is mostly concentrated in valley districts and along the great extent of deeply indented coast, where mountain and sea form the natural limitation of the areas of supply. The administrative development of electricity supply in Norway is best illustrated by the fact that, out of the 335 electricity works in operation in 1924, there were 304 municipal and district works, eighteen intermunicipal, five county-municipal, five large private power companies and three smaller works owned by the state.

*The largest transformer in Scandinavia, 29,000 kva., 143,000/12,000 volts*

The various administrations comprise, in rural districts, supply areas with from a few hundred up to 60,000 and 70,000 inhabitants. Of large supply areas which can conveniently co-operate, there is the so-called Eastland area, representing rather more than 10 per cent of the total area of Norway and containing a population of 1,100,000, of whom 500,000 live in towns and urban districts and 600,000 in purely rural districts. In this supply area, which includes the most closely settled parts of Norway, co-operation has already been established in great measure among the power works. In order to meet the demands of the area for electric energy for years to come the government is now developing the Nore Falls, which is capable of supplying about 150,000 kw. of electric energy.

Of a total population of 2,700,000, 1,900,000, or rather more than 70 per cent, can be supplied with electric energy from power works and distributing plants. Every town in the country is supplied with energy, and of 1,800,000 rural inhabitants approximately 1,080,000, or 60 per cent, can be supplied with energy from the power mains. As the density of population is less in Norway than in most European countries, this development gives



*The pioneer electrical manufacturer of Norway, Norsk Elektrisk and Brown Boveri, near Oslo*

one some idea of the labor that has been expended in the electrification of rural districts.

The heavy expansion of public service electricity can also be deduced from the amount of capital that has been invested to this end. On Jan. 1, 1916, it was computed that 127,000,000 kroner were locked up in electricity supply for public service, for household purposes and for industrial concerns of such size that they are not supplied with energy from their own plants. On June 30, 1925, the total of 870,000,000 kroner—nearly seven times the estimate of Jan. 1, 1916—was invested in power plants and lines for the delivery of energy at the consumer's house wall. This figure does not include plants that were under construction at that date or house installations, motors and household appliances. If these values are added, a rough estimate of the capital placed in electricity supplies for public service would be something like 1,200,000,000 kroner on Jan. 1, 1927.

The preponderating part of the public service supply is due to the initiative of municipal authorities. The great capital outlays for this purpose in recent years have, therefore, involved municipal and county authorities in a material increase of their burden of debt. According to the returns of the Central Statistical Bureau June 30, 1926, the following ratio existed between the total debt of municipal boards and their liabilities on account of electricity works:

| | Total Loan Debt (1,000 Kroner) | Proportion of Debt Devoted to Electricity Works (1,000 Kroner) |
|---|---|---|
| Districts and counties...... | 733,021 | 421,820 |
| Municipal boroughs........ | 772,204 | 293,594 |
| | 1,505,225 | 725,414 |

Of present municipal loans, approximately one-half has been devoted to electricity supply. Interest on and repayment of a substantial part of this debt is covered by the income accruing from the sale of energy. Income from this source amounted to about 83,400,000 kroner in the fiscal year 1924-1925. Total outlay for working expenses, interest, repayments, etc., amounted to 90,200,000 kroner. Expenditures thus exceeded income by about 6,800,000 kroner. This is mainly due to the fact that a large number of power and distributing plants, particularly those for rural supplies, were constructed during the boom period (see chart). Many of these works are at present experiencing difficulty in meeting their heavy annual expenses, part of which have had to be covered out of taxation, and the government, also, has been forced to give assistance in the form of loans, as well as direct grants.

The working results shown by the large joint municipal and county-municipal electricity works that have been completed in the last few years, and the financial burden under which so many local governments are straining, have led to the temporary culmination of the development of large distribution works in rural districts. A contributory cause is the fact that the most densely populated rural districts and those of the best financial standing have been electrified during the last ten or fifteen years. Many of the districts still remaining will unquestionably procure cheaper electricity by constructing small local works than by joining the large intermunicipal and county-municipal combines. For this reason, a number of small plants are now under way in many districts, the intention being to supply energy to hamlets, fishing stations and similar locations.

The writer gratefully acknowledges the whole-hearted co-operation and support of J. Vidnes of the Press Bureau of the Norwegian government, Christian Raestad, consulting engineer, Oslo, and Norberg Schulz, electricity director Central Board of the Norwegian Water Courses and Electricity Commission, in connection with the preparation of this article.

# Arc-Proofing Cables

By C. H. Shaw
*Engineer Distribution and Installation Department, New York Edison Company*

THE definite trend toward the use of higher voltages on underground cable circuits has increased the importance of the arc-proof covering that is placed on the cables in the manholes, especially when new cables are installed in conduit lines that already contain older cable systems.

An extensive series of experiments was undertaken by the New York Edison Company to determine the relative protective values of different combinations of refractory materials through the exposure of specially prepared test samples to controlled electric arcs in which the energy at the arc and the distance of the test material from the arc were maintained uniform, thereby providing test data that permit direct comparisons. These experiments were recently completed by the New York Edison Company after ten months of investigation. More than 170 samples were tested, each being subjected to from ten to fifteen burns. Two to four samples were made up of each type of material and for the more important cases the samples and tests were duplicated for verification.

The standard form of fireproofing, used by the New York Edison Company for more than fifteen years, consisted of an application of Portland cement (mixture 1 : 2) upon metal lath to a total thickness of approximately ⅝ in. over the entire cable sheath. In general, this form of protection has been satisfactory and in every case cables so protected have suffered little or no injury when exposed to manhole fires or short-circuit arcs in adjacent cables. It has always been realized, however, that the preparation and application of the metal lath to the cables was both tedious and objectionable, tedious, because of the necessity of cutting the lath into narrow strips, then rolling it, winding it onto the cable and tying it in place with string from small hand-wound bobbins; objectionable, because of the frequency with which the workmen were scratched or pricked, or, if not injured, delayed in their natural activities by excess carefulness or by the handicap of thick, cumbersome gloves.

TESTS ON CABLE ARC-PROOFING MATERIALS

| Description (all ⅝-in. thick) | Average Kilowatt-Seconds | Average of 2 Lowest Kilowatt-Seconds |
|---|---|---|
| **Older Types** | | |
| Cement (1:2) on metal lath | 1,126 | 486 |
| Cement (1:2) on ½-in. hemp rope | 1,047 | 656 |
| "Asbestoment" on single ½-in. "Niagrite" | 1,060 | 517 |
| "Asbestoment" on doubled ½-in. "Niagrite" | 838 | 494 |
| **New Types** | | |
| No. 4 "Asbestoment" on No. 1047 asbestos cloth | 1,343 | 999 |
| No. 4 "Asbestoment" on ⅛-in. perforated "Niagrite" | 1,539 | 1,019 |
| No. 4 "Asbestoment"—cheesecloth, inner and outer | 1,605 | 1,133 |

An appreciation of the hazards to which the workmen were exposed in handling the metal lath, a recognition of the desirability of discovering cable arc-proofing materials having greater protective values to accompany the increase in voltages and the hope for a less expensive type of covering were the reasons for undertaking this group of tests. The results that have been secured have more than justified the undertaking. The accompanying table gives comparative protective values of some of the older types of fireproofing and for the more important combinations that have been developed as a result of these tests. A great number of experiments were performed that did not give noticeably better results than could be secured from the older forms of fireproofing, but during these tests the advantages of reducing the thickness of the binder that holds the cement to the cable to a minimum became obvious. The advantage, even though slight, that is indicated for the inner and outer cheesecloth samples, was confirmed by tests of other materials applied in the same way.

The results obtained with the new "Asbestoment" No. 4 indicate not only a highly desirable increase in the average protection values but a marked improvement in the uniformity of the material as is revealed by a comparison of the averages of the two lowest tests of each group. This new material comes ready mixed as purchased and requires only the addition of a certain amount of water to give a proper working consistency to the cement just prior to its application. The cable is prepared by painting on a coating of hot paraffin over a winding of a layer of cheesecloth that has been purchased in rolls cut 4 in. wide. The No. 4 "Asbestoment" cement is applied over this layer of cheesecloth and is progressively bound in place by an outer layer of cheesecloth of the same dimensions as the inner layer. This outer layer insures a uniformity of the cement that cannot be secured when no outer binder is used and accounts for an appreciable improvement in the arc-resisting qualities of the material. This method of applying the cement to the cable is in accordance with the standard practice of the Philadelphia and Cleveland companies for the application of their Portland cement mixtures.

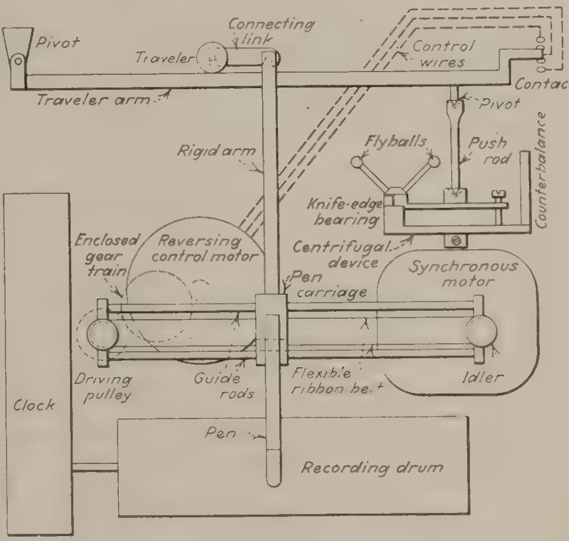
# Sensitivity—A Feature of Centrifugal Frequency Recorder

By F. S. Stickney
*Meter Engineer*
*Westinghouse Electric & Manufacturing Company*

A NEW type frequency recorder has been developed recently to meet the need for an extremely sensitive instrument for large alternating-current systems. When a mass is rotated by a synchronous motor the centrifugal force developed is proportional to the square of the frequency supplied to the motor. Application of this fundamental principle produces a recorder of great sensitivity, since large variations in operating force are produced by small variations in system frequency.

The operating principle of the new device may be explained by reference to the accompanying illustration. A self-starting synchronous motor running at relatively high speed drives a direct-connected centrifugal device which transfers centrifugal force into an axial thrust upon a vertical push rod. A traveler arm is pivoted at one end, the other end being supported by the push rod. The contacts are used to control a reversible motor, which operates a sliding pen carriage assembly along the traveler arm as the pen is moved.



*Centrifugal frequency recorder indicates instantaneous values*

As long as frequency remains constant the whole system of weights remains in equilibrium and the contacts remain open. Any increase in frequency increases the speed of the synchronous motor and throws the system out of equilibrium, thereby moving the pen carriage assembly up scale. As the assembly moves, the traveler is carried along the traveler arm, thereby increasing its moment about the pivot and tending to restore the system to equilibrium. When this is accomplished the upper contacts open and the control motor stops, leaving the recording pen in a new position further up scale, indicating an increase in frequency. When frequency falls the lower contact is closed and the cycle is reversed in a similar manner.

In operation any small change in system frequency immediately produces motion of the recording pen within a small fraction of a second. Being determined by mechanical dimensions and weights only, calibration is not subject to the errors from wave form, voltage or temperature which ordinarily appear in frequency-measuring devices.

# Boiler Feed Water Treatment in the Southwest

DATA regarding the conditioning of boiler feed water in ten representative generating stations were presented by Paul F. Hoots at the eighth annual convention of the Southwestern Geographic Division of the National Electric Light Association. The accompanying tabulation covers the major factors of treatment and operation.

*Boiler-Water Conditioning Practices Compared*

| Name of Station | Neches | Dallas | Fort Worth | Market Street | Oklahoma City | New Braunsfeld | Trinidad | Waco | Deepwater | Wichita Falls |
|---|---|---|---|---|---|---|---|---|---|---|

$NA_3PO_4$—Trisodium phosphate.
$NA_2HPO_4$—Disodium phosphate.
$NA_2CO_3$—Sodium carbonate (soda ash).
$NA_2SO_4$—Sodium sulphate.
$H_2SO_4$—Sulphuric acid.
$NAOH$—Sodium hydroide (caustic soda).

(a) Make-up high due to keeping lines hot n an inoperative low pressure plant, but being gradually reduced.

(b) Soon to be increased to 3–1.

(c) Sodium sulphate used is slightly acid. Soda ash is used to neutralize this acidity.

(d) Permutit softener just being installed and zeolite softened water will constitute evaporated feed.

(e) Average quantities added per 1,000 gal. feed water.

(f) Sulphates high enough without artificially increasing.

## *Simplified*
# Distribution Planning

Methods of calculating the economic characteristics of electrical distribution systems, particularly transformer spacing and sizes of line conductor

By W. R. Bullard
*Electric Bond & Share Company, New York City*

THE method of utilizing the equations, derived in the preceding articles, for the design of an actual overhead distribution system is given here. It is suggested that the steps noted in the summary be followed. The large number of equations may at first sight make the mathematics appear to be too complicated for practical use. However, since only a few of the equations need be used in any particular study of system economics and since the solution of the more complex equations is given in graphical form, the application of the equations will in most cases be comparatively simple. Furthermore, since the results, once obtained, will be applicable for a number of years in handling the growth of system load, the effort spent in making the calculations will in many cases be amply repaid by the economies that may be effected thereby.

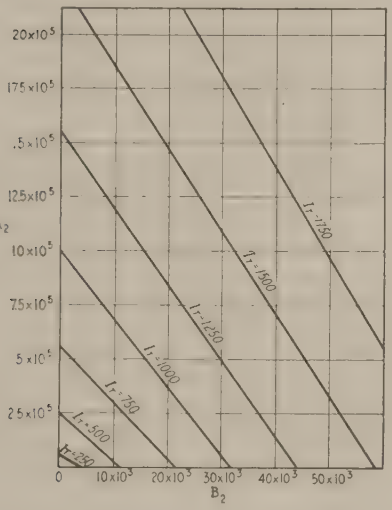

*Fig. 1 (left)—Graphical solution of equation 6 (Article III)*

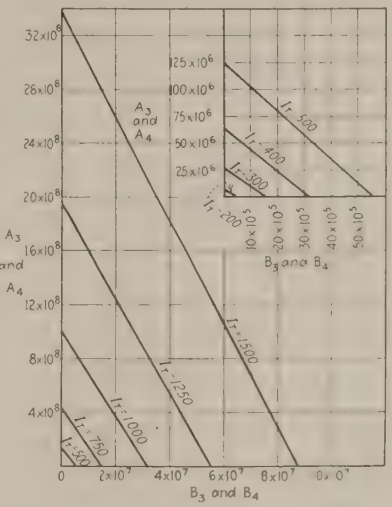
The numerical values of $A_2$ and $B_2$ for a given system when referred to the ordinates and abscissas represent a point on the surface. By interpolation between the valves of $I_T$ indicated on the curves the proper value of $I_T$ can be determined. This value will represent the most economical ampere load at the transformer.

*Fig. 2 (right)—Graphical solution of equations 10 and 14 (Article III)*

If voltage drop determines the size of conductors the point, the co-ordinates of which are the numerical values of $A_3$ and $B_3$, will give the most economical transformer ampere load by interpolation between the straight lines representing different values of $I_T$. If current-carrying capacity limits size of conductors the point, the co-ordinates of which are the numerical values of $A_4$ and $B_4$, will give, by interpolation, the economical transformer ampere load.



In the sample calculations given the values for the various constants are representative of a section of an actual system now operating in a Southern city.

The section chosen for the example is a residential section, the system having a 2,300/4,000-volt primary and three-wire, single-phase, 220-110-volt secondary. Transformers are set midway between street intersections.

*Calculation of Constants.*—Following is a summary of the values used for the various constants and the methods of obtaining these values.

*C*, the cost of copper loss expressed as a fraction of a dollar per kilowatt-hour, equals 0.03215. For the derivation of this value see example given in first article of this series in the section on "Unit Energy Costs."

$C_1$, the yearly cost of each transformer installation, including cost of losses and fixed charge on investment in dollars per installation per year, independent of size of transformer, is derived by the use of equation 3 (Article II), which gives the algebraic components that enter into this constant—that is:

$$C_1 = W_1 f C + 8{,}760\, W_2 C_4 + C_5$$

where $W_1$ equals transformer copper loss in kilowatts per transformer installation, independent of transformer size (intersection of axis of losses, Fig. 1 (Article II), ELECTRICAL WORLD, March 24, page 611); $W_2$ equals transformer core loss in kilowatts per transformer installation independent of transformer size (intersection of axis of losses, Fig. 1 of the second article of this series); $C_4$ equals cost of core loss in fraction of a dollar; $C_5$ equals annual fixed charges on cost of each transformer installation. For the derivation of $C_4$ see the example given in the first article in the section on "Unit Energy Costs."

In the investment from which $C_5$ is computed there are two items: First, the fixed component of trans-

---

**The last of a series of four articles. The first appeared in* ELECTRICAL WORLD, *March 10, 1928; the second and the third in the issues of March 24 and April 21, respectively.*

former purchase price, independent of size of transformer (this value is shown in Fig. 1 of Article II at intersection of the cost axis); second, the cost of installation including auxiliary apparatus, labor, etc.

The numerical value of the investment per transformer installation in the example selected is

| | |
|---|---|
| Fixed component of transformer cost (from curve).... | $56.00 |
| Installation and auxiliary apparatus .................. | 97.83 |
| | $153.83 |
| Thirty per cent for overhead expenses.................. | 46.17 |
| Total investment per transformer independent of size.. | $200.00 |

Annual fixed charge, or $C_5$, is 0.15 × $200 = $30.

Inserting the above values in equation 3 (Article II) (values for $W_1$ and $W_2$ being taken from Fig. 1 of that article), we have $C_1$ equal to 35.90.

$C_2$, the annual fixed charges on investment in line conductors in dollars per year per thousand circ.mils per 100 ft. of single conductor, is derived by using cost of copper per pound delivered at the job, which is $0.245. From this value the cost per 100 ft. per thousand circ.mils is $0.0951. The annual fixed charge, or $C_2$, is 0.15 × $0.0951, equals $0.01426.

$C_3$, the annual fixed charges on average total investment costs of primary laterals in dollars per year per 100 ft. of complete circuit, is derived as shown in the following:

| | |
|---|---|
| Additional cost of longer pole........................ | $7.00 |
| Crossarms, wire, labor, etc........................... | 22.30 |
| | $29.30 |
| Overhead construction expenses......................... | 7.33 |
| Total ........................................... | $36.63 |

---

# *List of Equations*

Note: Roman numerals indicate article in which formula originally appeared, thus, *I* refers to March 10; *II*, March 24, and *III*, April 21 issues of the ELECTRICAL WORLD

### GENERAL

Yearly cost of each transformer installation: $C_1 = W_1 fC + 8760 W_2 C_4 + C_3$

*(Equation II—3)* SEE FIG. 1 ARTICLE II

### PRIMARY

Economical current density in primary feeders:

$$I_F = \sqrt{\frac{C_2}{0.0011Cf}} \quad \textit{(Equation I—1)}$$

Economical current density in primary laterals:

$$I_L = \sqrt{\frac{3C_2}{0.0011Cf}} \quad \textit{(Equation I—2)}$$

### SECONDARY

*Two-Way Straight Line Feeds:*

Maximum voltage drop per conductor in secondary mains:

$$V = \frac{0.274 I_T^2}{aD} \quad \textit{(Equation II—1)}$$

Power loss in secondary mains:

$$W = \frac{0.183 I_T^2}{1000a} \quad \textit{(Equation II—2)}$$

*For Complete Economics:*

Economical secondary copper size:

$$a = 0.01352 I_T \sqrt{\frac{nfC}{n_1 C_2}} \quad \textit{(Equation II—4)}$$

Economical ampere load of transformer:

$$I_T = \frac{6.08\sqrt{C_1 D}}{(nn_1 fCC_2)^{1/4}} \quad \textit{(Equation II—5)}$$

*If Voltage Drop Limits the Size of Conductors:*

Secondary copper size:

$$a = \frac{0.274 I_T^2}{DV} \quad \textit{(Equation II—6)}$$

Economical ampere load of transformer:

$$I_T = 1.221 \sqrt[3]{\frac{C_1 V D^2}{C_2 n_1}} \quad \textit{(Equation II—7)}$$

*If Current-Carrying Capacity Limits Size of Conductors* (these equations apply to overhead conductors only):

Secondary copper size:

$$a = \frac{I_T^{4/3} b}{1170} \quad \textit{(Equation II—8)}$$

Economical ampere load of transformer:

$$A_1 = I_T^{7/3} + B_1 I_T^{5/3}$$

*(Equation II—9)* SEE FIG. 2, ARTICLE II

where $A_1 = \dfrac{878 C_1 D}{C_2 n_1 b}$ *(Equation II—10)*

and $B_1 = \dfrac{125.2 nfC}{C_2 n_1 b^2}$ *(Equation II—11)*

### FOUR-WAY NETWORK FEEDS

Maximum voltage drop per conductor in secondary mains:

$$V = \frac{0.0685 I_T^2}{aD} \quad \textit{(Equation III—2)}$$

Power loss in secondary mains:

$$W = \frac{0.04575 I_T^2}{1000a} \quad \textit{(Equation III—1)}$$

*For Complete Economics:*

Economical secondary copper size:

$$a = 0.00676 I_T \sqrt{\frac{nfC}{n_1 C_2}} \quad \textit{(Equation III—5)}$$

Economical ampere load of transformer:

$$A_2 = I_T^2 - B_2 I_T^{1/2}$$

*(Equation III—6)* SEE FIG. 1, ARTICLE IV

where $A_2 = \dfrac{74 C_1 D}{\sqrt{nn_1 fCC_2}}$ *(Equation III—7)*

and $B_2 = \dfrac{26.15 C_3 \sqrt{LD}}{\sqrt{nn_1 fCC_2}}$ *(Equation III—8)*

*If Voltage Drop Limits the Size of Conductors:*

Secondary copper size:

$$a = \frac{0.0685 I_T^2}{DV} \quad \textit{(Equation III—9)}$$

Economical ampere load of transformer:

$$A_3 = I_T^3 - B_3 I_T^{1/2}$$

*(Equation III—10)* SEE FIG. 2, ARTICLE IV

where $A_3 = \dfrac{7.3 C_1 V D^2}{n_1 C_2}$ *(Equation III—11)*

and $B_3 = \dfrac{2.58 C_3 V L^{1/2} D^{3/2}}{n_1 C_2}$

*(Equation III—12)*

*If Current-Carrying Capacity Limits the Size of Conductors.* (These equations hold only for underground conductors):

Secondary copper size:

$$a = \frac{I_T^2 b}{160{,}000} \quad \textit{(Equation III—13)}$$

Economical ampere load of transformer:

$$A_4 = I_T^3 - B_4 I_T^{1/2}$$

*(Equation III—14)* SEE FIG. 2, ARTICLE IV

where $A_4 = \dfrac{80{,}000 C_1 D}{C_2 n_1 b}$ *(Equation III—15)*

and $B_4 = \dfrac{28{,}280 C_3 \sqrt{LD}}{C_2 n_1 b}$

*(Equation III—16)*

### TWO-WAY NETWORK FEEDS

Maximum voltage drop per conductor in secondary mains:

$$V = \frac{0.391 L^{2/3} I_T^{4/3}}{aD^{1/3}} \quad \textit{(Equation III—4)}$$

Power loss in secondary mains:

$$W = \frac{0.2905 D^{2/3} L^{2/3} I_T^{4/3}}{1000a}$$

*(Equation III—3)*

*For Complete Economics:*

Economical secondary copper size:

$$a = 0.01703 \sqrt{\frac{nfC}{n_1 C_2}}\, D^{1/3} L^{1/3} I_T^{2/3}$$

*(Equation III—17)*

Economical ampere load of transformer:

$$A_5 = I_T^{5/3} - B_5 I_T^{1/2}$$

*(Equation III—18)* SEE FIG. 3, ARTICLE IV

where $A_5 = \dfrac{44 C_1}{\sqrt{nn_1 fCC_2}} \left(\dfrac{D^{2/3}}{L^{1/3}}\right)$

*(Equation III—19)*

and $B_5 = \dfrac{15.58 C_3 L^{1/6} D^{1/6}}{\sqrt{nn_1 fCC_2}}$

*(Equation III—20)*

*If Voltage Drop Limits the Size of Conductors:*

Secondary copper size:

$$a = \frac{0.391 L^{2/3} I_T^{4/3}}{VD^{1/3}} \quad \textit{(Equation III—21)}$$

Economical ampere load of transformer:

$$A_6 = I_T^{1/3} - B_6 I_T^{1/2}$$

*(Equation III—22)* SEE FIG. 4, ARTICLE IV

where $A_6 = \dfrac{1.92 V C_1 D^{4/3}}{n_1 C_2 L^{2/3}}$

*(Equation III—23)*

and $B_6 = \dfrac{0.678 C_3 V D^{5/6}}{n_1 C_2 L^{1/6}}$

*(Equation III—24)*

*If Current-Carrying Capacity Limits the Size of Conductors.* (These equations apply only to overhead conductors):

Secondary copper size:

$$a = \frac{I_T^{4/3} b}{1170} \quad \textit{(Equation III—25)}$$

Economical ampere load of transformer:

$$A_7 = I_T^{7/3} - B_7 I_T^{1/2}$$

*(Equation III—26)* SEE FIG. 5, ARTICLE IV

where $A_7 = \dfrac{877.5 C_1 D}{C_2 n_1 b}$

*(Equation III—27)*

and $B_7 = \dfrac{310 C_3}{C_2 n_1 b} \sqrt{LD}$

*(Equation III—28)*

The annual fixed charge, or $C_3$, is 0.15 × \$36.63, equals \$5.50.

The system in question has a three-wire, single-phase, 220-110-volt secondary; therefore, $n$ and $n_1$ are 2 and 3 respectively.

*D*, the load density at yearly peak load in amperes per 100 ft. per current-carrying conductor of secondary mains, was calculated from the substation load curves of the section considered with an allowance for diversity and an allowance for load growth for seven years in the future. Its value, 8 amp. per 100 ft., is the total yearly peak load of the section, including the above allowances, divided by the total length of streets in 100-ft. units.

*L*, the length of a block in units of 100 ft., by scaling off the streets on a map of the section was found to be 3.5.

Having found all the values of the constants, we can now proceed to use the equations involved in calculating the economical transformer spacing and copper size.

*Calculations for Complete Economics.*—Since the secondary mains have a network arrangement and transformers are located midway between street intersections, equation 18 (Article III), applies, or

$$A_5 = I_T^{5/3} - B_5 I_T^{1/2}$$

The most economical transformer ampere load, $I_T$, is found from Fig. 3, providing the values of $A_5$ and $B_5$ are known. The values for $A_5$ and $B_5$ are given by equations 19 and 20 of Article III, or

$$A_5 = \frac{44\,C_1}{\sqrt{CC_2n_1nf}}\left(\frac{D^{2/3}}{L^{1/3}}\right) =$$

$$\frac{44 \times 35.9 \times (8)^{2/3}}{\sqrt{0.03215 \times 0.01426 \times 3 \times 2 \times 1{,}600}\,(3.5)^{1/3}} = 1{,}972$$

$$B_5 = \frac{15.58\,L^{1/6}D^{1/6}C_3}{\sqrt{CC_2n_1nf}} =$$

$$\frac{15.58 \times (3.5)^{1/6}(8)^{1/6} \times 5.5}{\sqrt{0.03215 \times 0.01426 \times 3 \times 2 \times 1{,}600}} = 71.2$$

The value of $I_T$, which is found from Fig. 3 by interpolation, is 115 amp. The economical cross-sectional area of secondary mains required to carry this load is given by equation 17 (Article III), or

$$a = 0.01703\,\sqrt{\frac{nfC}{C_2n_1}} \times I_T^{2/3} \times L^{1/3} \times D^{1/3}$$

$$= 0.01703\,\sqrt{\frac{2 \times 1{,}600 \times 0.03215}{0.01426 \times 3}}$$

$$\times (115)^{2/3} \times (3.5)^{1/3} \times (8)^{1/3} = 59.9 \text{ M.C.M.}$$

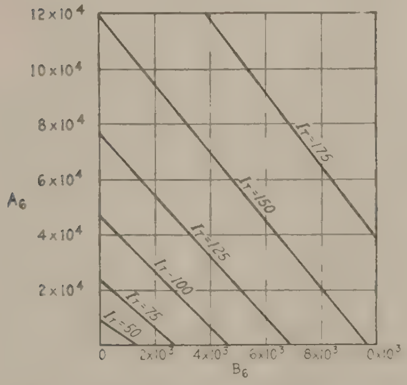


*Fig. 4 (left)—Graphical solution of equation 22 (Article III)*

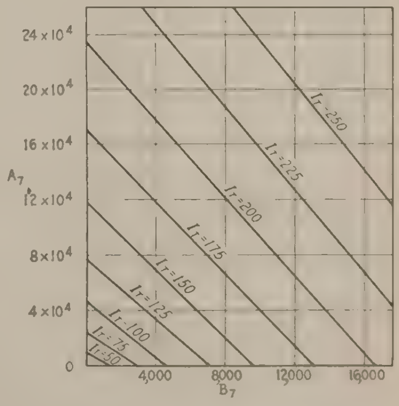
The point the co-ordinates of which are the numerical values of $A_6$ and $B_6$ will give, by interpolation, the most economical transformer ampere load.

*Fig. 5 (right)—Graphical solution of equation 26 (Article III)*

The point the co-ordinates of which are the numerical values of $A_7$ and $B_7$ will give, by interpolation, the most economical transformer ampere load.



By the use of equation 4 (Article III) the maximum voltage drop in secondary mains is found to be:

$$V = \frac{0.391\,L^{2/3}I_T^{4/3}}{aD^{1/3}} = \frac{0.391(3.5)^{2/3}(115)^{4/3}}{59.9 \times (8)^{1/3}} = 4.23 \text{ volts}$$

The assumed maximum allowable voltage drop per conductor in the particular system in question is 3 volts.

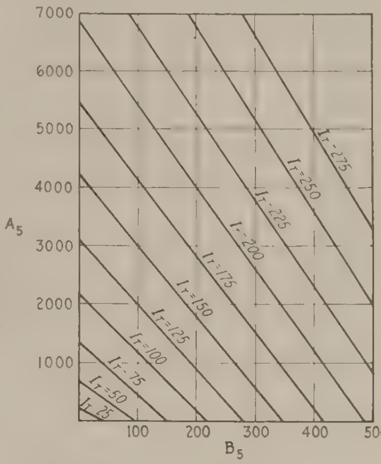


*Fig. 3—Graphical solution of equation 18 (Article III)*

The point the co-ordinates of which are the numerical values of $A_5$ and $B_5$ gives, by interpolation, the most economical transformer ampere load.

The above value is higher than this; therefore it is necessary to make a new set of calculations using equations that are limited by allowable voltage drop.

*Calculations With Voltage Drop as the Limiting Factor.*—Proceeding as in the previous case but using equation 22 (Article III), we have

$$A_6 = I_T^{7/3} - B_6 I_T^{1/2}$$

where

$$A_6 = \frac{1.92\,VC_1D^{4/3}}{n_1C_2L^{2/3}} = \frac{1.92 \times 3 \times 35.9 \times (8)^{4/3}}{3 \times 0.01426 \times (3.5)^{2/3}} = 33{,}600$$

$$B_6 = \frac{0.678\,VC_3D^{5/6}}{n_1C_2L^{1/6}} =$$

$$\frac{0.678 \times 3 \times 5.5 \times (8)^{5/6}}{3 \times 0.01426 \times (3.5)^{1/6}} = 1{,}202$$

The value of $I_T$, which is found from Fig. 4 by interpolation, is 98 amp. The cross-sectional area required to carry this load is given by equation 21 (Article III), or

$$a = \frac{0.391\,L^{2/3}I_T^{4/3}}{VD^{1/3}} = \frac{0.391 \times (3.5)^{2/3}(98)^{4/3}}{3 \times (8)^{1/3}}$$

$$= 68.3 \text{ M.C.M.}$$

The nearest practical wire size corresponding to this

## *Steps in Study of Distribution Economics*

THE various steps to be taken in applying the methods described to a study of the economics of any given distribution system are as follows:

1. Make a study of load characteristics and calculate the annual duration factor for copper loss and the cost of losses in the distribution system.

2. Make a study of the primary system in order to select the proper primary voltage and to determine the proper size of primary feeders and primary laterals.

3. Make a study of load densities of the system, calculating the prospective densities for several years in the future. Select two or three areas in the territory to be served, each area having reasonably uniform prospective load density. In each of the areas thus selected calculate the average distance between street intersections in both directions.

4. Determine upon the type of secondary system which is to be used—that is, whether three-phase, four-wire or single-phase, three-wire, etc.

5. Determine which set of formulas for economics of copper size and transformer spacing applies to each section of territory that has been selected as mentioned above—that is, whether it is to be network or straight line feed, two way or four way.

6. Calculate the economical transformer load current and secondary copper size for each section, assuming these values to be independent of voltage drop or current capacity of secondary mains.

7. From the values thus obtained determine whether the allowable voltage drop or current capacity would be exceeded.

8. If the current capacity or allowable voltage drop would be exceeded by the values obtained from the over-all economics, recalculate the values by the proper equations, depending upon whether voltage drop or current capacity is the limiting factor.

9. In a solidly interconnected alternating-current network system the copper size and transformer spacing may be limited by the ability to burn off low-voltage short circuits. The values obtained by the above procedure should be checked as to their relation to this feature and revised if necessary.

10. The values finally obtained for transformer load and copper size are average values to be used to serve the general distributed load of the system. These sizes should be adhered to in the majority of cases and the growth of load should be taken care of by setting additional transformers rather than increasing the transformer sizes, although it may be necessary to use somewhat smaller transformer sizes at the start in order to hold the voltage drop within the proper limits. If the load densities have been calculated for several years in the future, the values obtained by the described methods can usually be adhered to for a number of years without fear of varying materially from the proper economics. After a number of years, however, a new study should be made and new values adopted, for extensions and replacements of the system.

cross-sectional area is No. 2 A.W.G. The current in secondary mains nearest to the transformer is one-half of $I_T$, or 49 amp. This is considerably less than the current-carrying capacity of No. 2 wire. Therefore this size is satisfactory as far as temperature limitations are concerned, and no further detailed calculations are necessary.

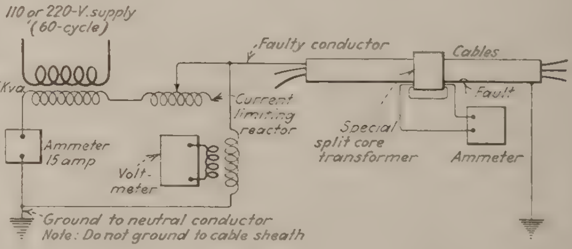
The transformer size corresponding to the above current is 220 × 98 equals 21.55 kva. The nearest practical size is 25 kva., which with an average load current of 98 amp. as indicated above, will leave a margin of safety of 14 per cent of the normal capacity of the transformer. This is sufficient, in the case under consideration, to take care of ordinary variations of loading under practical conditions, particularly since the load current indicated occurs only at the yearly load peak, and since a certain amount of overloading for short periods of time can be permitted.

Thus in the section of the system under consideration the average size of copper to use in the construction of secondary mains is No. 2 A.W.G. The average size of transformer required for a load density estimated for seven years in the future is 25 kva. For the present construction it will be desirable to use a somewhat smaller average size, say, 15 kva., gradually adding transformers of the larger size to the system and eventually standardizing upon 25-kva. transformers for serving the general distributed load of the system. Large concentrated loads will of course be served by transformers of sizes corresponding to the individual loads, plus small allowances for additional capacity for serving portions of the general system load.

In laying out and operating the system the transformer spacing will be determined by the percentage loading selected for the transformers. That is, in the case of the 25-kva. transformers the spacing must be such that the average transformer peak load will be 98 amp. Individual variations from this value will probably bring about the overloading of some transformers and the loading of others below the desired amount. However, the net result will be an over-all cost of distribution at or near the theoretical minimum value.

## Locating Underground Network Cable Faults

THE more or less delicate methods for locating faults which are used to good effect on high-voltage cables were not always so successful when they were applied to the low-voltage network cables of the Dallas (Tex.) Power & Light Company. The principal reason for the poor performance of these methods is the low conductor resistance as compared to the high fault resistance in the usual case of a fault, especially if it is under water. Recourse has been had, and successfully, to probably the simplest and oldest principle of all, but with a different type of testing equipment from that ordinarily used for such work.



110 or 220-V. supply (60-cycle)
15 Kva
Faulty conductor
Cables
Current limiting reactor
Fault
Special split core transformer
Ammeter 15 amp
Volt-meter
Ammeter
Ground to neutral conductor
Note: Do not ground to cable sheath

*Schematic diagram of test*

As shown in the accompanying illustrations the testing equipment consists of a 15-kw. transformer, a reactor and the necessary control and measuring equipment, which is mounted on a truck. One lead of the transformer is grounded, the other, at 4,000 volts, is connected to the faulted cable conductor and a current of 20 amp. applied at such intervals as desired for testing. The current is limited by the top connection to the reactor, a special form furnished by the States company. The exploring equipment consists of a special core transformer and an ammeter. On account of the relatively large diameter of the cable to be encircled by the transformer in comparison with the magnetic field surrounding the conductor, it is necessary for the transformer to be designed for very high sensitivity. To meet this requirement the Western-Electro Mechanical Company furnished a transformer with an extraordinarily large core and which weighs about 25 lb. The ammeter, which is really a very sensitive alternating-current millivoltmeter, is also of special design and is of the thermally operated type. The equipment has been in use for several years and has repeatedly demonstrated its convenience, speed and accuracy in locating various kinds of faults where other methods failed.

*Network cable fault locating apparatus*

## 188 Kw.-Hr. per Year per Cow

FIGURES compiled by the agricultural power committee of the Pacific Coast Electrical Association to show the value of one cow to the central station when the dairy is completely electrified give the following interesting results:

| Operation | Average Annual Consumption (Kw.-Hr.) |
|---|---|
| Milking | 25 |
| Pumping drinking water | 13 |
| Lighting barns, yards, etc | 5 |
| Cream separation | 1 |
| Sterilizing utensils | 100 |
| Milk cooling | 18 |
| Feed chopping | 26 |
| Total | 188 |

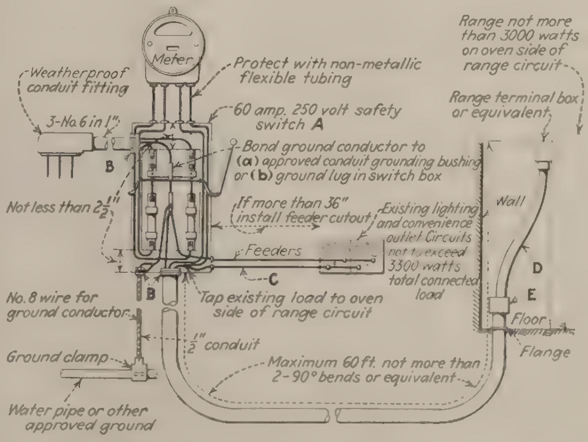
If alfalfa land is irrigated by electric pumping it was found that an additional 240 kw.-hr. per year per cow is required, assuming that the average pumping head is 40 ft. and that one acre of alfalfa is required to maintain one cow.

The report shows that all of the operations listed can be carried out to the economic advantage of the dairyman.

## New Range Wiring Standards Reduce Cost

ESTABLISHMENT of minimum range wiring specifications for installation of electric ranges in homes already wired, which will reduce wiring costs in many localities approximately 25 per cent, was one of the outstanding accomplishments of the Commercial Section of the Pacific Coast Electrical Association during the past year. With the new standards approved for a year's field trial by the California Association of Electrical Inspectors, one of the biggest obstacles in the past to the sale of electric ranges in California has been removed. If adopted by individual city inspection departments throughout the state a uniform minimum wiring standard will replace local rules of varying requirements heretofore in force.

Important features of the new standards are: Providing the lighting and convenience outlet load does not exceed 3,300 watts and the branch fuse cabinet is not more than 36 in. from the range service switch, a separate service and switch for the lighting is not required; providing there are not more than two 90-deg. bends or the equivalent in the conduit run from the service switch to the range, three No. 6 wires may be run in 1-in. conduit instead of 1¼ in., as previously required; No. 8 wire may be used for grounding the neutral of the range service instead of No. 6, as previously required, in case the range service consisted of three No. 6 wires; flexible conduit is now permitted in the run from the main service switch to the range; in practically all cases a switch at the range end of the conduit run is no longer required. Details of the new specifications are given in the accompanying schematic diagram.



Range not more than 3000 watts on oven side of range circuit
Meter
Protect with non-metallic flexible tubing
Weatherproof conduit fitting
Range terminal box or equivalent
60 amp. 250 volt safety switch A
3-No.6 in 1"
B
Bond ground conductor to (a) approved conduit grounding bushing or (b) ground lug in switch box
Not less than 2½"
If more than 36" install feeder cutout
Existing lighting and convenience outlet Circuits not to exceed 3300 watts total connected load
Wall
Feeders
C
D
E
No. 8 wire for ground conductor
B
Tap existing load to oven side of range circuit
Floor
½" conduit
Flange
Ground clamp
Maximum 60 ft. not more than 2-90° bends or equivalent
Water pipe or other approved ground

*Schematic range wiring for demands not exceeding 50 amp.*

*A*—Service switch may be installed: (*a*) Inside or outside family dwellings. (*b*) Inside each apartment or on same floor level outside each apartment, in two-family and multi-family dwellings.

*B*—Double locknuts and approved bushings on all conduits entering service switch box.

*C*—For surface work, if not over 12 in., protect with flexible tubing. If more than 12 in., install in metal conduit with approved fitting, or in metal gutter.

*D*—One-inch flexible metallic conduit not more than 36 in. Long enough to permit movement of range not less than 6 in. from wall.

*E*—Approved outlet box and cover or direct connection to end of range conduit run. Avoid unnecessary joints in range circuit conductors.

# Motion-Color

Philadelphia Electric Company provides exterior illumination of its new building to enhance civic attractiveness and demonstrate lighting possibilities

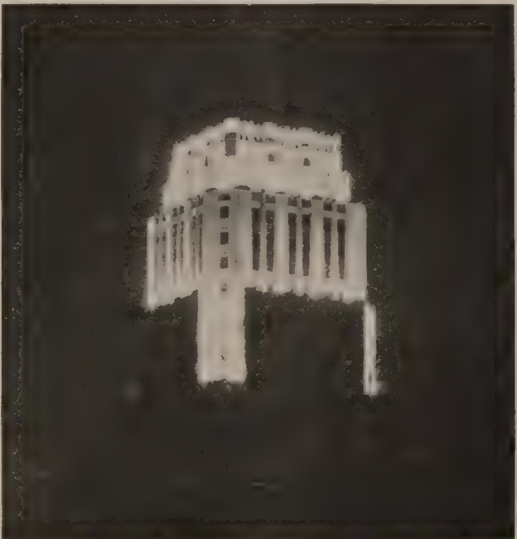
By Arthur A. Brainerd
*Assistant Illuminating Engineer*
*Philadelphia Electric Company*

IN FLOODLIGHTING its new 26-story building, the Philadelphia Electric Company decided that it should, if possible, be superior to the lighting of any similar building in the world. Leading floodlighting authorities were consulted and the following guides to designing the system were adopted:

1. The system must be flexible enough so that we could be assured of producing an effect that would be different from and more attractive than any installation installed in the vicinity within at least five years.
2. As far as possible the units should be located on the building and concealed from sight.
3. To secure the maximum value both color and motion should be used.
4. Adequate provision must be made for rapid changes in the arrangement of both color and motion media.

Very little definite information could be found on the wattage required for color illumination to produce satisfactory visibility at a distance of several miles, or on the desirable dimming speed for motion effects. Consequently experiments were conducted in which a 70x15-ft. panel having about the same reflection factor as the new building was illuminated and observations made at distances up to 1.75 miles.

These tests warranted the installation of two separate floodlighting systems—one to be normally equipped with clear lamps and connected to a theatrical dimmer and the other normally equipped with color. It was found that the clear lighting should have approximately 50 per cent of the wattage of the color lighting. Furthermore, the projectors equipped with clear lamps should be slightly nearer the building and slightly lower down than the color equipment. With the brick under consideration 8 to 9 watts per square foot produced excellent results.



*Night view from Washington Square with color and motion left to the imagination*

Referring to the illustrations it may be observed that the building is a towered structure, with a small rectangular balcony at each corner on the fifteenth floor and balconies on three sides on the eighteenth and twenty-second floors. There is also a narrow balcony on the fourth side of the twenty-second floor. Below this level the wall of the building is unbroken. The majority of people will view the building from a distance of half a mile or more.

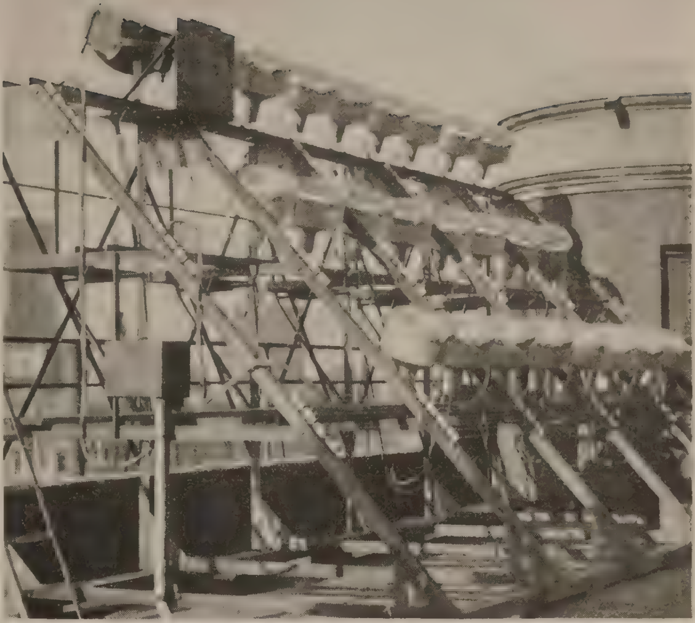
On each fifteenth floor corner are placed 30 500-watt projectors, ten connected to a dimmer circuit and the rest directly across the line. These units are placed on steel framework as far from the building as possible. The space covered is from the fifteenth to the twenty-second floor. On the eighteenth floor, on the north, east and south sides, the projectors are grouped in front of the pilasters, which are of two widths (2½ ft. and 7 ft.) and extend to the twenty-second floor. The groups consist of three projectors and nine projectors respectively for the narrow and wide pilasters. One-third of these projectors were on dimmers. On the twenty-second floor the arrangement was more irregular, but the same general rule was followed. Except where wide pillars jut out into the balcony all projectors are mounted close to the parapet

# Floodlighting

and as high as possible. The total number of projectors on this floor is 162, 62 of which are dimmers.

On the twenty-third story level there is a wide ledge which cannot be reached satisfactorily by projectors. On each of these ledges was mounted a 200-watt prismatic vapor-proof unit turned base out and equipped with a natural finish colored lamp. The units stand out as jewels and entirely relieve the harsh shadow which otherwise would exist.

The west side of the building from the eighteenth to the twenty-second floors is illuminated by two banks of projectors on the roof of the adjacent building, consisting of 48 1,000-watt projectors, sixteen of which are on dimmers. At this level there are also two 18-in. incandescent searchlights to take care of two inaccessible spaces above the twenty-second floor.



*A bank of 29 projectors*

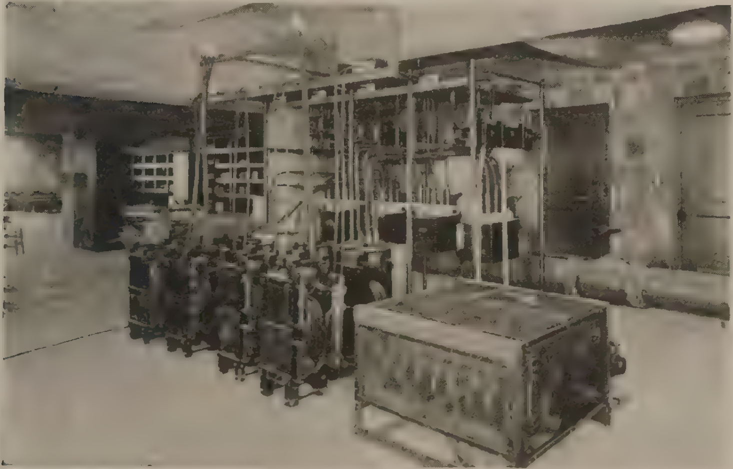
Dimming is provided by a four-element Ward-Leonard reactive dimmer of 90-kw. capacity located on the seventeenth floor. Three speed changes are provided, making possible a complete cycle of 30 seconds, one minute, or two minutes duration. Each of the four levels is provided with a pair of reactors and separate cams so that they may be dimmed simultaneously or progressively. The cams are so constructed that any desired change in sequence of dimming may be made in ten minutes. Flexibility in adjusting and changing of colors is secured by standardizing on two units, a 500-watt projector with a recess in the reflector to receive a color cap and a 1,000-watt projector which will accommodate a specially designed inner color lens. A complete change in color arrangement may be made within a very few hours. The whole arrangement constitutes in effect a big floodlighting experimental station. It is possible at any time to have a color system, a white system or a continuously changing system, and the arrangement of both color and dimming can be altered at will.

The total load on the system amounts to 262 kw., divided as follows: 419 500-watt Pittsburgh F.L.C. projectors, 48 1,000-watt

*At right — One of vapor-proof units on 23d floor balcony*

*Below, left — 90-kw. reactive dimmer controlling white lights*

*Below, right — Arrangement of projectors on eighteenth floor balcony*



Pittsburgh F.L.C. projectors, two 18-in. General Electric incandescent searchlights and fourteen 200-watt Holophane vapor-proof units. Normally the system is equipped with 219 Laco-Phillips color caps and 34 Laco-Phillips color lenses.

It is greatly to the credit of the manufacturers who co-operated with the lighting service department of the Philadelphia Electric Company that all of the material was manufactured, delivered, installed and adjusted within four weeks after the first order was given.

In the brief time that the system has been in operation it has excited widespread comment and already requests have been received to prepare plans for two large office buildings.

# Utility Attitude on Oil Burners

POWER companies are keenly interested in domestic oil burners as a means of building up the residential load, declared Charles K. Nichols of the New York Edison Company, in an address before the recent convention of the American Oil Burner Association. They are most interested, he asserted, in the particular appliance or type of appliance that will help to improve load factor and the oil burner meets this requirement very well. About one year ago the question of the domestic oil burner as an appliance which the central-station companies should encourage came up and it was found that one large company was successfully promoting the sale of this equipment. Outlining the attitude of the power companies, Mr. Nichols continued:

"Since last summer the central stations have gone into this matter a little more carefully and in two of our largest associations, the National Electric Light Association and the Association of Edison Illuminating Companies, committees have been formed to investigate this question of oil burning and to report back, if possible, this summer or this fall, whether or not this is a matter which our companies should take on. We want apparatus that is efficient. We want apparatus that is going to function over a reasonable length of time with very little servicing.

### Customer Relations a Factor

"The position of the central stations with their customers is a rather unique one. For years we have been trying to build up good customer relations. I believe that we have accomplished something along those lines, for we now find that our customers come to us and ask what apparatus they shall buy. For that reason we must be very careful to find out what apparatus there is that we can safely recommend.

"If we are handling an oil burner, if an oil burner appears on our floors for demonstration, it means that the company that has put that oil burner there, the central station that is advocating its use, tacitly guarantees that that oil burner may be used by our customers without mistake.

"In our merchandising methods there are very great differences. Some companies on one hand believe that it is advisable to select one piece of apparatus and merchandise. There are other companies which undertake to sell the idea of burning oil, advertise that, try to promote it by demonstration, have half a dozen burners on the floor, if possible, each one good, each one advertising the use of oil. There are others that will fall between those two classes, some selling them and having a manufacturer or a dealer install and service them, and merely working as an adjunct to that dealer.

### A Parallel Situation

"This is the way in which the central stations have handled a business that seems to be very analogous with the oil burner. That is the domestic refrigerator. About five years ago the domestic refrigerator came rather forcibly to our attention, and for two years we investigated them, tested them, tried them out under all possible conditions, and finally in 1925 we felt that the refrigerator was here to stay, that it was no longer a luxury, that the price was such that our customers could

## *Number and Population of Communities with More Than One Voltage*

From report of N.E.L.A. Lamp Committee (F. W. Smith, chairman)

| Lighting Voltage | Number of Communities | | | | | Population of Communities (1920 Census) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 1923 | Per Cent | 1928 | Per Cent | Change | 1923 | Per Cent | 1928 | Per Cent | Change |
| 110 volts only | 6,976 | 47.7 | 3,751 | 19.9 | —27.8 | 21,224,500 | 33.6 | 9,211,100 | 14.8 | —18.8 |
| 115 volts only | 5,226 | 35.6 | 12,879 | 68.2 | +32.6 | 24,302,900 | 38.5 | 36,748,100 | 58.8 | +20.3 |
| 120 volts only | 1,197 | 8.2 | 2,088 | 11.1 | + 2.9 | 7,147,300 | 11.3 | 12,980,600 | 20.8 | + 9.5 |
| Total, one standard voltage only | 13,399 | 91.5 | 18,718 | 99.2 | + 7.7 | 52,674,700 | 83.4 | 58,939,800 | 94.4 | +11.0 |
| More than one standard voltage, one station | 435 | 3.0 | 62 | 0.3 | — 2.7 | 1,407,600 | 2.2 | 1,075,900 | 1.7 | — 0.5 |
| More than one standard voltage, more than one station | 102 | 0.7 | 33 | 0.2 | — 0.5 | 6,934,000 | 11.0 | 2,323,200 | 3.7 | — 7.3 |
| Total, standard voltage(s) only | 13,936 | 95.2 | 18,813 | 99.7 | + 4.5 | 61,016,300 | 96.6 | 62,338,900 | 99.8 | + 3.2 |
| 112 volts only | 118 | 0.8 | 9 | ..... | — 0.8 | 333,500 | 0.5 | 28,200 | 0.1 | — 0.4 |
| 125 volts only | 88 | 0.6 | 13 | 0.1 | — 0.5 | 189,100 | 0.3 | 19,800 | 0.1 | — 0.2 |
| Other voltage below 130 volts | 162 | 1.1 | 9 | ..... | — 1.1 | 667,100 | 1.1 | 5,100 | ..... | — 1.1 |
| 200 volts or higher | 260 | 1.8 | 20 | 0.2 | — 1.6 | 252,500 | 0.4 | 15,600 | ..... | — 0.4 |
| Standard and odd voltages, one station | 59 | 0.4 | 1 | ..... | — 0.4 | 337,000 | 0.6 | 800 | ..... | — 0.6 |
| Standard and odd voltages, more than one station | 16 | 0.1 | 3 | ..... | — 0.1 | 316,000 | 0.5 | 75,800 | ..... | — 0.5 |
| Grand total | 14,639 | 100.0 | 18,868 | 100.0 | ....... | 63,111,500 | 100.0 | 62,484,200 | 100.0 | ....... |

afford to buy them in large quantities, so we advocated the use of electric refrigeration very strongly, some selling one particular refrigerator, others selling the idea of mechanical refrigeration for domestic use.

"Since that time perhaps conservatively half a million electric refrigerators have been purchased and put on the power companies' lines. We still have our committees that are promoting the use of the refrigerator, and I see no reason if the oil burner is to our minds a successful piece of apparatus, as the refrigerator now is, why we cannot handle this in practically the same way.

"I believe that if we find the oil burner is a satisfactory piece of apparatus, as we believe it has been shown within the past year, the advantages of co-operation between the central stations and the oil burner companies will become more and more apparent."

## Electric Annealing of Brass Shows Good Economies

RECENT experience in electric brass annealing shows advances in economy by the use of selective load control, according to a paper by R. M. Keeney before the Bridgeport meeting of the American Electrochemical Society. A representative Connecticut plant installed a 350-kw. furnace in 1924 with "on and off" control and annealed yellow brass tubing in small sizes and thin gages with a power consumption of 110 kw.-hr. per ton (2,000 lb.), or 18.2 lb. per kilowatt-hour. The inside muffle dimensions were 16 ft. by 4 ft. by 18 in. Annealing was done at a muffle temperature of 1,200 deg. F., and the outfit has been in service for nearly four years, running ten hours per day without a coil burnout or any furnace maintenance expense. The first furnace has been followed by two more 350-kw. units.

The first furnace has coils in the bottom, two sides and top of the muffle, with two control groups, each covering one-half the length of the muffle. Its production[*] was increased to 20 lb. per kilowatt-hour, or 100 kw.-hr. per ton, by the development of a selective[†] load control. The increased efficiency appears due to the more rapid absorption of heat by the mass of tubing in the furnace, because convection currents are established. This is contrary to the general opinion that all heating in an electric resistance furnace is by radiant heat and suggests that possibly mechanical circulation of a furnace atmosphere may prove beneficial in increasing the speed of annealing. The two later furnaces have four control groups each, two being in the bottom and two in the sides and arch. These additional control groups were installed because it was found that the bottom coils should be on most of the time and should be arranged for independent operation. In these two later furnaces, equipped with load control, the production is 24 lb. per kilowatt-hour, or a consumption of 83 kw.-hr. per ton.

The installation was made entirely on an economic basis, Mr. Keeney states, a large saving in pickling cost and labor having been demonstrated by experiments prior to the purchase of the first furnace. The pickling time has been reduced to about 25 per cent of the previous requirements, because there is much less oxidation of the tubing, which has cut the labor cost in two and materially reduced the acid consumption. This electric furnace installation anneals brass tubing at a cost for annealing and pickling of $2 to $2.50 per ton less than the former wood-fired muffles and results in a yearly return on about 50 per cent of the furnace investment.

---

[*] *Production about 18,000 lb. per ten-hour day.*—EDITOR.

[†] *The "selective load control" keeps down demand charges and raises the efficiency of the furnace by fluxing the heat around the interior. Zones of heating are operated alternately under control of a timing device for a predetermined period (six minutes in this case), the input being shifted from one to the other as long as heat is required in both zones. When one zone reaches a cut-off point, i.e., a predetermined temperature, the furnace immediately goes off the time cycle and operates in the usual way.*—EDITOR.

## Planting the Electrical Idea in Fertile Soil

STUDENTS in the mechanical engineering shops at Stanford University receive their training in as modernly equipped a foundry and shop as may be found anywhere. Electric melting and heat-treating equipment installed during the past year gives the student the advantage of the best equipment and latest foundry and shop practice and he goes forth to his chosen field with a knowledge of electrical methods which better enables him to cope with such present-day industrial problems as he may encounter.

In the foundry is to be found a 100-kw. Electromelt steel furnace with a capacity of 125 lb. per hour and a Young Brothers shelf-type core-baking oven with Bristol automatic control Heat-treating equipment consists of a 30-kw. Hagan box-type heat-treating furnace with Wilson-Maculen temperature control, a 10-kw. General Electric box-type heat-treating furnace with Leeds & Northrup recording control, a Rockwell-Sentry laboratory model heat-treating furnace with carborundum heating elements and dilatometer control and a Leeds & Northrup Hump heat-treating furnace

*Electric melting and heat-treating equipment used at Stanford University in teaching modern foundry and shop practice*

# Markets in Brazil

### Some observations by Howard A. Lewis, an American manufacturer, recently returned from a study of South American conditions

BRAZIL presents a most appealing market for American electrical products, according to Howard A. Lewis, vice-president in charge of the development of export markets for the Kelvinator Corporation of Detroit. Mr. Lewis has just returned from an extended trip to South America and brings with him some interesting observations on conditions there. He sees Brazil, from the electrical standpoint, as standing where America did twenty years ago, with this difference, that she is starting on her era of intensive electrical development with all the advantage of modern American practice at her hand.

#### DOMESTIC APPLIANCE FIELD LARGE

"The cities of Rio de Janeiro and São Paulo, the two chief centers of population in Brazil, have been electrified for years," said Mr. Lewis. He continued:

"The Pearson Engineering Company developed hydro power for both cities. With the growth of these cities there came a shortage of electricity. Recently additional hydro powers have been completed, and there is now a surplus. Nearly every home in Rio is wired. The population went from candles to electricity. The use of domestic appliances has not yet gone very far. The same condition applies in São Paulo. Rio is one of the most dramatically lighted cities in the world, miles of electrically lighted boulevards following the shore line and curve after curve of light with straight strings of illumination climbing the mountainsides. In Rio electricity has been used to beautify, in São Paulo electricity has been used for power. These two cities are now controlled by the Canadian General Finance Corporation. A progressive program is under way which will make for the greater use of electricity in the homes and in industry. A program of trade co-operation headed up by the Rio company has been inaugurated and the best of American and English association practices are being followed.

#### RATE STRUCTURES BEING STUDIED

"Rates for lighting in Rio have been 800 reis or (at 12 cents the milreis) 9.6 cents American a kilowatt. The power rate starts at 500 reis or 6 cents American a kilowatt. A scientific study is now being made of the Rio rate structure, and a new domestic rate, probably with a sliding scale of charges, is soon to be set up. It is estimated that there are more than 120,000 domestic meters in Rio. In São Paulo the domestic rate is 720 reis of 8.64 cents American a kilowatt, and the power rate 200 reis or 2.4 cents American a kilowatt. The estimates give 80,000 domestic meters in São Paulo.

"There are many smaller hydro plants in Brazil. In the State of São Paulo alone it is estimated that there are more than 300 communities, large and small, served with electricity. The most important electrical development in Brazil; in fact, the most important single industrial development in the country, has been the advent of the Electric Bond & Share Company of New York. This group has already taken over Bahia, Victoria, Nictheroy and the Riberao Preto district in São Paulo. It is understood that it has options on many other desirable properties. Already it represents the largest American interest in Brazil. The program includes the building of new hydro-electric plants, the rehabilitation of existing plants, high-tension transmission and a progressive commercial development campaign. It is able to draw on the best of American experience for engineering, operation and commercial development. The existing organization is a fast-moving, modern crowd, already on a par with the best of the central-station organizations in the States. Adequate power at fair rates, with the skill to sell the idea of electricity as a labor-saving tool for industry, for the home and for agriculture, will be this organization's contribution to the growth of this empire of the south.

"There are three large electrical trading organizations in Brazil, the General Electric S. A. of Brazil, the German A.G.E. and Siemens. The Brazilian G.E. operates through seven branches, with the head office at Rio. This company manufactures lamps, and besides selling G.E. products it does some independent trading with other manufacturers. The American Westinghouse is represented by a Brazilian organization, Byington & Company. The Byington interests also control and operate light and power properties. Besides these large electrical organizations there are many smaller trading houses, handling American, English, German, Danish, French and Italian lines. For electrical apparatus and fabricated products Brazil draws from all the world.

"As for credit terms, you run the gamut in Brazil, from cash against documents in New York to consigned stocks, and anywhere in between. Local interest rates are high and much organized propaganda has been set up as to terms that must be given in order to do business. Before the financial crash of 1920-21 the American commission houses did business on a 120-day sight basis, and these terms were, up to that time, more or less standard. Today the merchandise, the salesmanship involved and the standing of the respective firms are the controlling credit factors.

#### BRAZIL OFFERS OPPORTUNITIES

"Brazil is now entering the period of centralized and unified power station operation and control, plus the era of diversified electric applications, both commercially and domestically. What the States was electrically twenty years ago is now being repeated here. With a present population of 37,000,000 and room for 100,000,000 people, Brazil offers large opportunities for American enterprise. It should be understood by our electrical exporters, however, that this market will not be won by men who go down there and gang together with the American and English colonies. There is entirely too much of that, too much drinking and loafing by men who fail to study the national viewpoint and to become a part of the life of the country. These men are apt to fail and come back to the States to tell how hard it is to sell in South America. It is in this that the Europeon has been surpassing the American. The Latin nations of Europe have been exporting to Brazil not only dollars and goods but ideas, ideals and people who settle there and add their lives and work to the wealth of the nation. The British have sent goods and money. The Germans have sent goods, money and people. America must send ideas and sympathy, as well as dollars, plus enthusiasm, management and engineering skill, to help them build and develop the market in which we hope to share. We must forget many of our home traditions and absorb the traditions of Brazil, that we may effectively help them create a greater electrical market. No man can go there with the mere idea of exploitation and hope to succeed."

# Letters from Our Readers

## *Dr. Stratton Misinterpreted on Maine Power Exportation*

*To the Editor of the* ELECTRICAL WORLD:

I am very much surprised to learn of the interpretation that, according to a news item printed in your issue for June 2 (page 1163), has been placed upon my remarks at Bangor. In the first place, there was nothing whatever in my written paper concerning the Maine law as to exportation of electric power. In emphasizing the assistance that scientific and technical graduates of New England educational institutions could give in developing the industries of the State of Maine, I did remark that by keeping in touch with modern chemical and metallurgical developments they might be able to find uses for electrical current near the point of generation, where current is the principal factor in the process.

The question as to whether the law is best for the interests of the State of Maine is an economic one involving many factors, and about which I did not express an opinion.

S. W. STRATTON,
President Massachusetts Institute of Technology.
Cambridge, Mass.

## *Securing Accurate Results with Calculating Table*

*To the Editor of the* ELECTRICAL WORLD:

In transmission networks the ratio of reactance to resistance is frequently so large that satisfactory results can be obtained on the calculating table by using only the value of reactance. In underground systems the ratio of reactance to resistance is smaller and much larger errors enter into the results by the neglect of the resistance. Since the voltages consumed in a network by the reactance and resistance are in quadrature it is not permissible to combine the reactance and resistance into an equivalent impedance for use in setting up the calculating table.

The following method properly allows for the quadrature relation and yields a true value for the short-circuit currents. Three steps only are involved in the solution, viz.:

1. Set up the calculating table with resistance values only and determine the current. Let it be $I_r$.
2. Again set up the calculating table with reactance values only and determine the current, $I_x$.
3. Substitute these values into the formula

$$I_{sc} = \left\{ \left[ \frac{\frac{1}{I_r}}{\frac{1}{I_r^2} + \frac{1}{I_x^2}} \right]^2 + \left[ \frac{\frac{1}{I_x}}{\frac{1}{I_r^2} + \frac{1}{I_x^2}} \right]^2 \right\}^{1/2}$$

The formula is arrived at directly, thus, $I_r = \frac{E}{R}$ and $I_x = -j\frac{E}{X}$ and also, $I = \frac{E}{Z} = \frac{ER}{R^2 + X^2} - j\frac{EX}{R^2 + X^2}$.

The "in phase" component is $\frac{ER}{R^2 + X^2}$ and the "quadrature" component is $\frac{EX}{R^2 + X^2}$

When the readings are taken on the calculating table they are $\frac{E}{R}$ and $\frac{E}{X}$ so, to establish the equalities $\frac{EK}{R} = \frac{ER}{R^2 + X^2}$ and $\frac{EK^1}{X} = \frac{EX}{R^2 + X^2}$ it is apparent that $K = \frac{R^2}{R^2 + X^2}$ and $K^1 = \frac{X^2}{R^2 + X^2}$.

So $I_{sc} = \sqrt{\left( I_r \frac{R^2}{R^2 + X^2} \right)^2 + \left( \frac{E}{X} \frac{X^2}{R^2 + X^2} \right)^2}$

$$= \sqrt{\left[ I_r \frac{\frac{E^2}{I_r^2}}{\left(\frac{E}{I_r}\right)^2 + \left(\frac{E}{I_x}\right)^2} \right]^2 + \left[ I_x \cdot \frac{\frac{E^2}{I_r^2}}{\left(\frac{E}{I_r}\right)^2 + \left(\frac{E}{I_x}\right)^2} \right]^2},$$

$$= \sqrt{\left[ \frac{\frac{1}{I_r}}{\frac{1}{I_r^2} + \frac{1}{I_x^2}} \right]^2 + \left[ \frac{\frac{1}{I_x}}{\frac{1}{I_r^2} + \frac{1}{I_x^2}} \right]^2}$$

The formula is simpler to use than may appear. Let the setting on resistance alone yield $I_r$ as 1,000 and the setting on $X$ alone yield 250 units—any units. Then in the same units,

$$I_{sc} = \left[ \left( \frac{10^{-3}}{10^{-6} + 16 \times 10^{-6}} \right)^2 + \left( \frac{4 \times 10^{-3}}{10^{-6} + 16 \times 10^{-6}} \right)^2 \right]^{1/2}$$
$$= \left[ \frac{10^{-6}}{(17)^2 \times 10^{-12}} + \frac{16 \times 10^{-6}}{(17)^2 + 10^{-12}} \right]^{1/2}$$
$$= \left( \frac{17 \times 10^{-6}}{(17)^2 \times 10^{-12}} \right)^{1/2} = \left( \frac{10^6}{17} \right)^{1/2} = 243 \text{ units}$$

In the analytic solution of a network the treatment can deal separately with the resistances and reactances, i.e., consider the network first as containing only resistance and then as containing only reactance, and the results be combined as indicated. This affords a check method for solutions derived in the regular way.

L. S. FOLTZ,
Head Electrical Engineering Department.
Michigan State College,
East Lansing, Mich.

## *Service Testing of Meter Transformers*

*To the Editor of the* ELECTRICAL WORLD:

Referring to the article on "Service Testing of Meter Transformers" in the April 28, 1928, issue of the ELECTRICAL WORLD, I would like to call your readers' attention to the fact that this article was written before the Southern Power Company had changed its name to the Duke Power Company, hence the confusion in names.

The cost of testing was small at the time. I have checked it again this spring and it runs even less. Including time loss and overhead expenses the cost would be around \$6 or \$7. The cost of changing and testing was estimated on a basis of traveling considerable distances and should not average over \$10 or \$12. However, estimated costs differ, so they can be depended upon only when local conditions are known.

The accuracies given are high, but were obtained over several years by different men; a number of checks were made on standard transformers and their curves. Errors of potential transformers tend to balance those of current transformers and the trouble with the bad types of transformers, connections, cables, etc., were eradicated in first tests. This method has located troubles with much greater ease and rapidity than the usual method. Later tests on the meters do not show materially different results.

We would like to hear from any one who has developed methods of field testing current transformers of less than 300-amp. capacity.

BEDFORD J. BROWN,
Superintendent Meter Department.
Duke Power Company,
Charlotte, N. C.

# Digest of Electrical Literature

## *Hydro-Electric Development and Steam Equipment*

*The Development of the Gatineau River.*—The program under which the development of the Gatineau River has proceeded and the three separate projects which have been undertaken in order to complete the comprehensive scheme have been outlined. The design and operating factors involved in the three generating stations installed for the utilization of this power have been fully covered, with particular reference to the paper mill constructed as a part of the scheme and constituting an essential feature of the development. The present installed capacity amounts to 436,000 hp. The Gatineau Company has contracted to supply the Hydro-Electric Power Commission of Ontario with 260,000 hp. of 25-cycle power for its Niagara system for a period of 30 years and 100,000 hp. of 60-cycle power for its eastern Ontario district. The 25-cycle power will be supplied at 220 kv. and that for the 60-cycle system at 110 kv.—*Electrical News (Canada)*, May 15, 1928.

*The Combustion of Coal.*—F. H. Rosencrants.—A review of the past development, the present position and the trend of progress in the use of solid fuel, with particular reference to pulverized fuel and stoker firing. It is stated that the rapidity with which the process of combustion of pulverized coal may be carried out depends upon several factors, namely, the coal should be reduced to infinite fineness: the coal and air should be preheated to the ignition temperature of the coal; the coal and air should be brought together in correct proportions and as a perfect mixture at the furnace entrance. The author adds that under these conditions combustion would be instantaneous, but that as it is neither practical nor economical to reduce coal to infinite fineness and as the ignition temperature of coal is in no case much more than 900 deg. F. little is to be gained by preheating the air beyond the more practical limit of 400 to 600 deg. F., and that in the absence of infinite or atomic fineness it is impossible to realize the intimacy of association of coal and oxygen specified as the ideal. The various factors involved have been considered, including a comparison of the advantages of the storage system and the unit pulverizer.—*Electrical Review (England)*, May 18, 1928.

## *Transmission, Substations and Distribution*

*Toronto Terminal for 220-Kv. Gatineau Power.*—The new 220,000-volt step-down transformer station of the Hydro-Electric Power Commission of Ontario possesses a number of unusual features. The high-voltage lines from the Ottawa River development terminate on the 220-kv. bus at this station and may be disconnected from it by means of oil circuit breakers. Provision is made for isolating each circuit breaker by means of disconnecting switches, so that repairs may be made without interrupting service. The breakers are of unusual size and are said to be the largest in physical size and rupturing capacity yet manufactured. Complete interruption is accomplished in one-half second. The high voltage terminal of the main transformers is connected to the bus and transformation is made in the windings of the transformers to 110,000 volts and 13,200 volts. Each transformer is rated at 15,000 kv. and has three windings insulated from each other. Direct interconnection with another system is effected through 110,000-volt windings and bus construction. Synchronous condensers are employed to regulate the voltage over the 230-mile line supplying this station. — *Electrical News (Canada)*, May 1, 1928.

*Cable-Laying Improvements.*—E. S. Byng.—The efficient use of labor-saving, mechanical appliances in cable-laying practices is considered in this article, one of a series on similar topics, with particular reference to British practice. The devices include compressed-air-operated tools, trench-digging machines, back fillers, tampers, concrete mixers, thrust borers, installation appliances, motor winches and pumps. It is stated that the whole economical use of any mechanical appliance depends in large measure upon the factors of cost of manual labor in relation to machine cost for a similar operation; amount of work to be done; suitability of locality for machine operations, and selection of suitable type of machine, bearing in mind capital cost and maintenance charge and also facilities for obtaining spare parts.—*World Power*, May, 1928.

*Excitation Systems and Their Influence on Short Circuits and Maximum Power.*—R. E. Doherty.—A new regulator, unique in its operating characteristics, has been developed which makes it possible to maintain stable operation under the conditions of dynamic stability, thus increasing the maximum power by taking advantage of the heretofore unexploited range of operation of synchronous machines. Comparative test results are given for different types of regulators. The new regulator indicated an extraordinary gain, giving an increase in maximum power from a steady state value from 110 kw. to a maximum of 415 kw. on a system comprising a synchronous generator supplying power directly to a synchronous motor. The excitation system as controlled by the new regulator provides a component of excitation voltage which is at all instants equal to the drop in the field circuit during the necessary small oscillations under dynamic stability. With zero effective field resistance, the maximum power corresponds to the condition of constant flux linkages, the power under that condition being greatly increased above the constant field current value.—*Journal of the American Institute of Electrical Engineers*, May, 1928.

## *Units, Measurements and Instruments*

*A Thermal Method of Standardizing Dielectric Power Loss Measuring Equipment.*—J. H. Scott, H. W. Bousman and R. R. Benedict.—The need for reference standards in dielectric power loss measurements at high voltage and commercial power frequencies have been reviewed and a thermal method for measuring dielectric power loss in cables utilizing the sheath temperature rise associated with the flow of heat due to the power loss within the sheath has been offered. Sources of error are discussed briefly and results are given in comparison with the measurements of dielectric power loss by the reflecting astatic, electrodynamometer wattmeter, using an air capacitor for phase-angle compensation. Certain possible errors in dynamometer measurements are noted, with particular reference to the effect of humidity on power loss in the air capacitor.—*Journal of American Institute of Electrical Engineers*, May, 1928.

*Sodium-Peroxide Bomb Calorimeter.*—A bomb calorimeter in which the use of oxygen for combustion purposes has been replaced by that of solid sodium-peroxide mixed with the fuel to be tested is described. It is stated that the oxygen bomb calorimeter remains the standard instrument, but that it is inconvenient for routine work and expensive. There are a number of advantages claimed for the device described in this discussion, namely, the ease with which the equipment may be dismantled and sulphur determinations made: the water equivalent of the calorimeter is determined by a test with pure benzoic acid, the calorific value of which is well known; the difference between the theoretical calorific value and the value observed to give the loss of heat by radiation and in other ways, and volatile liquid fuels may be readily tested in this device.—*Engineering (England)*, May 18, 1928.

*The Microscopic Examination of Some Electrical Insulating Materials.*—Arthur B. Everest.—The first test to be applied to an insulating material must obviously be directed toward ascertaining its electrical properties. Underlying the properties of any material are its composition and structure, and it is in determining these as well as in the study of defective material that microscopic examination has proved of value to the electrical engineer in connection with his study of insulating materials. The author has undertaken a considerable microscopic examination of various materials, including insulating papers, varnished cloths and vulcanized fiber and has analyzed the influence of certain characteristics as indicated in the tests upon their value as insulating media.—*Engineering (England)*, May 18, 1928.

## *Illumination*

*Intensity of Light and Speed of Vision Studied with Special Reference to Industrial Situations—Part II.*—C. E. Ferree and G. Rand.—This study is a continuation of the program outlined in an earlier paper and the investigation has been extended to include conditions of work as sampled from industrial situations supplementing the earlier determinations. In the first series of experiments described in the present discussion the effect of intensity of light was investigated for light objects on dark backgrounds and a comparison made with the effect for dark objects on light backgrounds. In the second series of experiments a color difference was introduced of a kind frequently found in industrial situations. In the third experiment the effect of intensity of light on the speed of reading a steel vernier rule was determined. Other points included are: Study of the cause of the difference in results obtained for dark objects on light backgrounds and vice versa; the measurement of the size of the pupil under certain conditions; the individual differences in speed of discriminating white and black objects on gray backgrounds, and several similar physiological determinations.—*Transactions of the Illuminating Engineering Society*, May, 1928.

## *Electrophysics, Electrochemistry and Batteries*

*Adsorption Phenomena in Primary Cells.*—E. O. Jegge.—The adsorption phenomena are stated by the author to constitute important factors in the dry cell. In this discussion the characteristics of various chemical constituents are considered and the resulting effect upon the life of the cell outlined.—*Report of American Electrochemical Society*, April, 1928.

*The Development of the Process and Equipment for the Manufacture of Chemically Pure Acid by Electrical Distillation.*—C. M. Hoff.—The demand for a better method for the manufacture of chemically pure hydrochloric acid led to the present investigation. Efforts were directed toward developing a continuous process, first employing fuel heating and later electrical energy for distillation. Paramount difficulty was the obtaining of materials of construction that would meet all the requirements. The result of this work was a continuous process that utilized electrical energy in place of fuel, reduced greatly the operating costs and breakage, advanced the quality of the product and improved the working conditions. This process and apparatus are also adapted, it is said, to the manufacture of chemically pure nitric acid, although introducing additional problems in the selection of materials of construction.—*Report of American Electrochemical Society*, April, 1928.

*Behavior of Plating Baths and Anodes During Electrodeposition of Chromium.* — Richard Schneidewind and Stephen F. Urban.—In this study of the behavior of chromic acid plating baths during electrolysis special emphasis has been placed on the relationship between anodes and the solution composition. If all plating conditions are kept constant, trivalent chromium in the bath approaches an equilibrium concentration, a condition of steady state. The magnitude of this concentration is a function of the following conditions: Anode current density; the nature of the anode material; temperature of the bath, and the sulphate concentration of the bath. Where iron anodes were used they dissolved at a constant rate during electrolysis. Lead is less soluble at low temperatures, but proved even more soluble at high temperatures than iron. Dissolved iron and trivalent chromium greatly contract the range of current densities at which good plate is produced.—*Report of American Electrochemical Society*, April, 1928.

*Electrochemical Production of Graphitic Oxide.*—Bruce K. Brown and Oliver W. Storey.—Graphitic carbon may be oxidized to a deflagrating oxide of carbon having the properties of graphitic oxide when used as an anode in a neutral or an acid electrolytic bath containing oxidizing anion. The authors conclude as a result of their investigation that dilute nitric acid with or without the addition of an oxidizing salt is the preferred electrolyte for producing electrochemical graphitic oxide. A low current density and a low temperature electrolyte are conditions required to fix the greatest amount of oxygen. Best current efficiencies and the highest percentage of fixed oxygen are obtained by using impregnated anodes. The available oxygen in graphitic oxide may be determined by the ferrous sulphate method, the available oxygen being somewhat lower than the total oxygen obtained by combustion.—*Report of American Electrochemical Society*, April, 1928.

## *Traction*

*Chicago Terminal Electrification of the Illinois Central Railroad.*—R. F. Schuchardt and W. M. Vandersluis.—The general problem of railroad electrification has been considered with particular reference to the installation on the system of the Illinois Central in Chicago. The local conditions involved in the design and construction work of this carrier, the analysis prepared in connection with desirable sources of power supply, and the fundamentals of the contract entered into by the railroad and the power utility, are outlined by the authors. The rolling stock and method of energy distribution as well the substations and their equipment are noted, and operating experiences to date are given. It is stated that the high-speed circuit breaker is the major item of importance in the equipment and that this device has done all that was expected of it. Both in correct selectiveness and in effective current interruption its behavior is said to have been excellent. Power requirements under varying load conditions and classifications of traffic are given.—*Report of American Institute of Electrical Engineers*, May, 1928.

## *Miscellaneous*

*Strength of Interlocking-Rib Tile Walls.*—A. H. Stang, D. E. Parsons and A. B. McDaniel.—A number of walls were examined in the course of this investigation regarding the strength of interlocking rib tile masonry. Four walls were stressed in compression, three under transverse loading and one was subjected to a transverse load before being tested in compression. Lime, cement-lime and no mortars were used in the horizontal joints. Spaces between the terminal ribs of the tiles in the walls were grouted. The strength of the walls both under vertical and transverse loads was affected by the workmanship and the mortar beds. The wall with cement-lime mortar beds sustained a maximum transverse load about 2½ times that taken by the wall with lime mortar beds and higher than any other wall tested so far at the Bureau of Standards. A specially designed tile was used. The compressive strength of the other cement lime mortar bedded walls was about 2½ times that of the other wall with lime mortar bed.—*No. 366 Technologic Papers of the Bureau of Standards.*

*Brittleness Tests for Rubber and Gutta-Percha Compounds.*—By G. T. Kohman and R. L. Peek, Jr.—An insulated material compounded of rubber, gutta percha or of similar substances becomes brittle at a temperature characteristic of the material below which it may not be used if subject to mechanical stress. The authors have devised an apparatus for determining the temperature by giving the sample a sharp bend through a fixed angle. The highest temperature at which fracture occurs in this test has been found to be nearly independent of the bending angle and the sample's dimensions provided the rate of bending is maintained at a nearly constant rate. A modified form of this equipment is also described, by means of which the brittle temperature may be determined when the material is under high hydrostatic pressure. The constancy of the brittle temperature when determined under different conditions suggests that it marks a change in the structure of the material. — *Reprint B-287, Bell Telephone Laboratories, Inc.*

# Book Reviews

## *Die Messwandler*

By I. Goldstein. Berlin: Julius Springer, 166 pages, 130 illustrations. 1928.

The growing importance of measuring apparatus and protective relays in modern high-voltage plants and networks has increased the interest in the necessary current and potential transformers, yet the present book is the first one dealing with this subject to appear in European literature in almost twenty years. Volumes on transformers in general, while in themselves of rather infrequent appearance, find it beyond their scope to consider measuring transformers with more than a mere mention. Designers and operating engineers will therefore welcome this highly practical book, covering all phases of the subject in a concise manner. Mathematical treatment is subordinated to vector analysis and other graphical representations. The fact that the author is a member of a large German concern, and that only the products of this concern are used to illustrate the book, does not seem to lessen the general appeal of the publication. However, it does not seem logical to devote five-sixths of the book to current transformers and only one-sixth to potential transformers.

## *The Story of Public Utilities*

By Edward Hungerford. New York: G. P. Putnam's Sons. 384 pages, 81 illustrations.

The purpose of this book is well expressed in the foreword by Mrs. Henry G. Danforth, president Board of Education, Rochester, N. Y., who says: "'The Story of Public Utilities' aims to give in as simple a way as possible a picture of the origin, the development, the general organization and the practical workings of the utilities which serve our cities and our country. It is written in the belief that the increasing importance of public utilities in home, industrial and civic life justifies the inclusion of such a study as a part of the supplementary work in the social studies and the science classes of our public school system.

"The publication of the work is in no sense a commercial venture. For this reason the copyright has been vested in the Children's Memorial Scholarship Fund, Inc., and royalties accruing from the sale of the book will be devoted to the purposes of the fund. It enables pupils to continue in school who would otherwise be obliged to withdraw from financial necessity."

The book fulfills its purpose very ably. The author, a well-known writer on travel and transportation, has treated his subject in an interesting manner, uncommon to most literature on the subject. While the book is devoted chiefly to the historical development, two chapters treat briefly the service organization, policy, financing and regulation of utilities.

The criticism made of some books on public utilities can hardly be justified in this case because the book is confined to facts and does not include discussions of argumentative subjects. No comparisons of government, municipal and private ownership or operation are made. The book has received the indorsement of the Rochester (N. Y.) Board of Education.

## *Electric Traction on Italian Railways*

(La Trazione elettrica sulle ferrovie Italiane.) Published by the Minister of Railways and Communication in connection with the Volta Centenary in 1927. Board covers, illustrated, 194 pages and two large maps.

In a country like Italy, where coal is expensive but water powers are abundant, it is not surprising that a great deal of attention should have been paid to railway electrification. Up to Sept. 1, 1927, there had been built and put into operation by the Italian government heavy electric traction lines comprising 1,149.8 km. (718.5 miles) of route and 2,399 km. (1,499 miles) of track, and there was in course of equipment 257 km. (161 miles) of route and 744 km. (465 miles) of track.

These figures, with a great deal of other good information, are contained in a book recently issued by the Minister of Railways and Communication of the Italian government. It is divided into five sections as follows: General statistics and discussion; detailed information of the electrical equipment and distribution system of each of the lines of the State railway system; data on the sources of electric power supply; detailed information of the electric locomotives; brief information in regard to 33 interurban electric railways that do not form a part of the State railway system.

The book is very well illustrated, among the prints being two large maps. One shows all of the interurban and trunk electric railway lines in Italy. The other is on a larger scale and shows the electrified lines in the Milan-Genoa-Leghorn district, with their transmission lines.

## Book Notes

ELEMENTS OF MACHINE DESIGN. By Prof. J. D. Hoffman, Purdue University, Lafayette, Ind., and Prof. L. A. Scipio, Robert College, Constantinople, Turkey. Boston, Mass.: Ginn & Company. Engineering Series, 327 pages.

Treats of the fundamental mechanics of machine construction, covering materials and forces involved in design. Mechanical driving equipment is comprehensively discussed, with practical problems set forth with unusual clarity. Nine chapters are devoted to shafting, keys, couplings, flywheels and pulleys, belt and rope drives, friction gearing, spur, bevel and screw gearing, bearings, flat plates, pipes, cylinders, joints and fastenings. Design applications are analyzed in the remaining seven chapters, featuring press, jib crane, punch, shear, overhead traveling crane, the Scotch marine boiler and the kinematics of machines.

WISSENSCHAFTLICHE ABHANDLUNGEN DER PHYSIKALISCH TECHNISCHER REICHSANSTALT. Band XI, Heft 2. Berlin: Julius Springer. 108 pages.

The latest group of papers, continuing this well-known series, again touches on many fields: Properties of materials, especially cobalt and nickel alloys; the photometry of diffusely transmitting glassware; new methods for sundry types of measurement, to mention only a few. The longest contribution reports the results of another attempt to unravel the acoustical complexities of speech sounds.

THE "ELECTRICIAN" ANNUAL TABLES OF ELECTRICITY UNDERTAKINGS 1928. By *The Electrician*. London: Ernest Benn, Ltd. 200 pages. Price, 10 shillings, net.

This book comprises data on 800 British and 1,300 colonial and foreign electrical undertakings. Details of generating plants, which were omitted during the war, have been restored and additional data included. Among the information covered are: Voltages and frequencies used; generator plant rating and system load; output; and energy rates.

STORAGE BATTERIES SIMPLIFIED. By Victor W. Page. New York: Norman W. Henley Publishing Company. 258 pages, illustrated. Price, $2.

This book is a non-technical treatise discussing the development of the modern storage battery, outlining the basic operation of the leading types. Also the methods of construction, charging, maintenance and repair. Practical applications of commercial batteries are shown and described. Includes special instructions for care and repair of automobile batteries and glossary of terms, also storage batteries for radio.

## Books Received

*Elektrische Vollbahnlokomotiven.* By Dr. Karl Sachs. Berlin: Julius Springer. 461 pages, illustrated. Price, 84 marks.

*Hochfrequenzmesstechnik.* By Dr. Ing. August Hund. Berlin: Julius Springer. 525 pages, illustrated. Price, 39 marks.

*Intermediate Electricity and Magnetism.* By R. A. Houston. New York and London: Longmans, Green & Company, Ltd. 170 pages, illustrated. Price, $1.75.

*The Story of Electricity.* By Hermann Goodman. New York: Medical Life Press. 62 pages, illustrated. Price, $1.50.

*Scientific Purchasing.* By Edward T. Gushee and L. F. Boffey. New York: McGraw-Hill Book Company. 195 pages. Price, $3.

*Electric Heating.* By Edgar A. Wilcox. New York: McGraw-Hill Book Company. 569 pages, illustrated. Price, $5.

*Storage Batteries.* By Morton Arendt. New York: D. Van Nostrand Company, Inc. 281 pages, illustrated. Price, $4.50.

*Die Physikalischen Grundlagen der elektrischen Festigkeitslehre.* By N. Semenoff and A. Walther. Berlin: Julius Springer. 166 pages, illustrated. Price, 16½ marks.

*Die Selbsttaig Signalanlage Der Berliner Hoch- Und Undergrundbahn.* By Alfred Bothe. Berlin: Julius Springer. 164 pages, illustrated. Price, 32 marks.

# News of the Industry

## Republican Platform and the Utilities

### Satisfaction Expressed at Indorsation of State Regulation and Reiterated Opposition to Government Ownership—Rate Feature of Muscle Shoals Bill

By Paul Wooton
Washington Correspondent of the Electrical World

NO REPRESENTATIVE of the public utilities appeared before the resolutions committee of the Republican National Convention at Kansas City last week, and it is understood that the reference to public utilities in the platform came from within the committee. The text of the utilities plank follows:

> Republican congresses and administrations have steadily strengthened the Interstate Commerce Commission. The protection of the public from exactions or burdens in rates for service by reason of monopoly control, and the protection of the smaller organizations from suppression in their own field, has been a fundamental idea in all regulatory enactments. While recognizing that at times federal regulations might be more effective than state in controlling intrastate utilities, the party favors and has sustained state regulation, believing that such responsibility in the end will create a force of state public opinion which will be more effective in preventing discrimination and injustices.

In another plank, headed "Home Rule," the platform says:

> There is a real need in the country today to revitalize fundamental principles; there is a real need of restoring the individual and local sense of responsibility and self-reliance; there is a real need for the people once more to grasp the fundamental fact that under our system of government they are expected to solve many problems themselves through their municipal and state governments, and to combat the tendency that is all too common to turn to the federal government as the easiest and least burdensome method of lightening their own responsibilities.

Representatives of the utilities industry are pleased with the declaration as to the advisability of state regulation, but some will take issue with the statement that federal regulation might be more effective.

It is believed that all the utilities wanted to see in the platform was a declaration against the government in business. In that they were not disappointed. At several points in the platform positive commitments are made against such a policy. In the agricultural plank, for instance, the party pledge specifies that its aid will not go to the point of putting the government into business, and in the merchant marine plank the outright statement is made that "the Republican party does not believe in government ownership or operation."

The Republican platform is silent on Muscle Shoals, Boulder Dam and federal water-power policy in general.

That feature of the Muscle Shoals bill requiring that the charge for electricity to the ultimate consumer must not exceed an amount fixed by the Federal Power Commission as reasonable, just and fair is believed to have been one of the major reasons for the President's pocket veto. The question of the constitutionality of federal regulation of electric rates was raised in Congress, and some members argued that there need be no fear of an invasion of the rights of the states as the courts certainly would find that portion of the bill unconstitutional.

The President has very decided views as to the propriety of passing legislation thought to be in conflict with the constitution. While the government operation features of the bill doubtless were highly objectionable to him, it is conceivable that he might have made concessions in that regard because of the unusual situation surrounding the properties of the government at Muscle Shoals. The President also had taken a decided position against getting the government in deeper at Muscle Shoals, and the inclusion of the Cove Creek dam in the bill doubtless had an important bearing on his action.

Had the bill become a law it is doubtful that the power companies in the South would have been willing to take any of the power because of the conditions attached to its use. It also is thought more than possible that the state commissions themselves, rather than surrender jurisdiction over an indeterminate amount of power, might decline to sanction contracts between the utilities and the federal government.

### Power Commission Criticised

Some spokesmen of the power industry are much concerned over the action of the Federal Power Commission in ruling that no application for a license or an amendment to a license will be considered by the commission itself until the amounts of preliminary expenditures approved by the commission's staff for inclusion in the capital cost of the project shall have been accepted by the applicant. It is asserted that had such a regulation been put into effect with the enactment of the water-power law few important licenses would have been issued. The last annual report of the Federal Power Commission shows a long list of license cases in which the pre-license costs have not been determined. Had the new policy been in effect when these licenses were considered, they could not have been issued up to the present time. Bureaucratic supervision and legislative attacks are declared to have about reached the point where the development of water-power resources has been effectually checked.

## Norris on Warpath

### *Nebraskan Assails "Power Trust" in Unmeasured Terms, Likening It to "Old Man of the Sea" and Comparing Its Menace to That of Slavery*

IN THE July issue of a radical publication called *Plain Talk* Senator George W. Norris of Nebraska makes a violent assault upon the light and power industry—the "power trust," as he terms it—declaring it to be "riding Uncle Sam like the mythical Old Man of the Sea rode Sindbad the Sailor" and demanding government competition as "the one sure method by which its strangulation grip can be broken." "Abraham Lincoln once declared that this nation could not survive half slave and half free," the Senator says. "We settled that problem by abolishing chattel slavery. In my opinion, an analogous situation exists today—and one equally dangerous to the republican institutions of our country. If the United States government cannot control the power trust, it follows as night follows day that the power trust will control the United States government." Much more follows to the same effect.

Mr. Norris scouts the tax argument. He thinks "the government could vastly undersell private companies and yet get profit ten times as great as the lost taxes," and that if the sources of power controlled by five dominant interests—which he enumerates as the General Electric, Doherty, Morgan, Ryan and Insull interests—can be "regained by the public" and potential water-power resources fully developed, electricity will be "as freely used in the average home as running water." The Ontario Hydro system and the Tacoma (Wash.) municipal plant are invoked to support his contentions.

Senator Norris also came out immediately after the Republican National Convention with a savage attack on its platform, criticising among many other things its silence on the various matters affecting the utilities that have recently figured prominently in political news. He said: "The platform is silent as to Boulder Dam, Muscle Shoals and the 'lame duck' constitutional amendment. It says nothing about the water-power trust. In fact, it is 100 per cent perfect as judged from the power trust viewpoint."

# Investigation Records Personal Opinions

## Director of Missouri Committee Admits Activities That Did Not Commend Themselves to His Private Judgment—Oklahoma Committee Has Its Turn

MORE or less exploitable matter was brought to light when the Federal Trade Commission's investigation into the public utility companies was resumed on Wednesday of this week. Correspondence between J. B. Sheridan of St. Louis, director of the Missouri Committee on Public Utility Information, who took the stand, and John W. Colton of New York, former editor of *Aera*, a magazine published by the American Electric Railway Association, taken presumably from Mr. Sheridan's files, showed that the writers were personally by no means in complete harmony with all utility activities as they conceived them. Mr. Colton, for instance, had denounced "the lying, trimming, faking and downright evasion of trust or violation of trust that mark the progress toward enormous wealth of some of the so-called big men in the industry," and Mr. Sheridan had congratulated him on his protest against an alleged plan of utility companies and organizations to "brand all advocates of government ownership as reds and bolshevists." Mr. Sheridan had also expressed an academic opinion that "the man who invented private ownership was a mortal enemy of the human race."

In his testimony about his committee's work Mr. Sheridan said, according to Associated Press reports, that his organization had sought to prevent Carl D. Thompson, head of the Public Ownership League, from filling a speaking contract on a Chautauqua circuit in 1924 and that a special committee appointed to prevent him from making the speeches discussed the question of whether to "annihilate or modify" him and the latter course was decided upon. Letters also were introduced into the record to show that pressure was brought to bear on Keith Vawter, of the Redpath-Vawter Chautauqua, and that in some places Thompson was prevented from giving his lecture.

Mr. Sheridan testified that his committee expends an average of $15,700 annually. Four pamphlets on the utility industry have been furnished the heads of schools, he testified. He admitted that $50 had been paid Prof. A. S. Langsdorf of Washington University for writing a description of the pamphlets, of which 15,000 of each had been issued. The employment last year of E. J. McCausland, dean of engineering at the University of Missouri, to make speeches at $75 each and expenses at three Missouri state teachers' colleges was also put in evidence. Mr. Sheridan said he had taken an active part in promoting utility advertising in the newspapers as a means to good will.

Mr. Sheridan is reported to have frankly admitted that he used methods not in line with his own convictions.

On Thursday of last week, June 14, Fred R. Jenkins of Chicago, chairman of the educational committee of the National Electric Light Association, told of the action of a joint committee composed of representatives of his association, the American Gas Association and the American Electric Railway Association in discussing textbooks with publishers with the result that some chapters of a volume by Howard Copeland Hill of a Chicago high school which referred to public utilities were revised.

H. J. Gonden, publisher of the *Public Service Magazine* of Chicago, testified that a survey costing $105,000 was carried out under the auspices of the magazine to obtain complete information regarding ventures and experiments into public ownership of utilities. An account of the survey was published in abbreviated form and more than one thousand copies of the set of 24 volumes were distributed. Half the money for this, Mr. Gonden said, was put up by the magazine and the other half raised by subscriptions of $1,200 each taken by various utility companies and committees on information and utility publicity. Earlier in his testimony the witness had stated that the 300 shares of the preferred stock of the publishing corporation was owned by officials of public utility company or representatives of the companies.

On Friday various activities of the Oklahoma Public Utility Information Bureau in schools and colleges, on the lecture platform, in the circulation of news releases and in connection with legislation were outlined by Edward F. McKay, manager of that bureau. Mr. McKay defended the procedure of his bureau in everything that had been done, explaining that it was its prime purpose to acquaint the people of the state with public utility work. He said that he had been responsible for the establishment in the University of Oklahoma of a course in public utility and business administration. While he did not believe the news letter sent out by his committee affected editorial opinion to any great extent, he did think it was proper for the utility interests to influence public opinion in favor of private ownership if the facts presented warranted such influence. It was the effort of his organization, he said, to present the facts.

The witness denied any knowledge of money alleged to have been used as a bribe in the Oklahoma Senate. He said that the matter of a survey of textbooks in the Oklahoma schools had been called to his attention but that nothing in that direction had been done. "I think it would be a perfectly proper thing to do," he added. He testified that thousands of speeches on utilities had been made in Oklahoma during the past few years to hundreds of thousands of persons. His organization had spent from $20,000 to $30,000 a year during recent years in carrying on its work.

Commissioner McCulloch announces that public hearings will not be held between July 6 and Sept. 1, although the field work and office activities connected with the investigation will go on. The commission's fourth interim report has been issued. It is accompanied by eleven volumes of stenographic transcripts of evidence from May 15 to June 14 inclusive.

# New Generating Plant Is in Prospect for New York

When the stockholders of the Consolidated Gas Company of New York City meet on July 16 to vote on the proposed absorption of the Brooklyn Edison Company they will, according to President George B. Cortelyou, who makes this announcement in a letter to stockholders, be asked to authorize plans now being completed for the erection of a generating plant to supply service to all the boroughs of the city. This plant will, if the plans are carried out, be built on the Brooklyn side of Buttermilk Channel, opposite Governor's Island, in the harbor, and on a site already owned by the Brooklyn Edison Company.

# A. H. Harris Explains Sale of Mohawk Valley Company

Alleged mystery in the sale last week of New York Central Railroad holdings in the Mohawk Valley Company and New York State Railways to the E. L. Phillips power interests, involving a transfer of nearly $42,000,000, was scouted this week at Rochester by Albert H. Harris, chairman of the executive committee of the railroad. Current rumors had it that the sale was prompted by anticipation of difficulties with the Interstate Commerce Commission should the New York Central purchase power from one of its own companies to electrify its main line from Buffalo to Harmon, by the possibility that the Mohawk Valley Company's outlet for power had been cut off at the east by the Mohawk & Hudson Company, at the west by Niagara Falls power developments and at the south by the Phillips interests, and by reports that the railroad would use proceeds of the sale to retire indebtedness of the Lake Shore Railroad.

None of these alleged facts, according to Mr. Harris, was the foundation for the sale. The holders, he said, were motivated chiefly by the offer of a fair price and the fact that the New York Central is concerned first with railroad operation. "The railroad received various offers during the last five years for its holdings in the Mohawk Valley properties because of their strategic importance, but up to the last few months had given no serious thought to selling," Mr. Harris said. "No one can tell when electrification is coming since the drawback to extensive electrification has been the initial cost. The Rochester company would not be able to supply all the power needed for such a project."

## Purchases and Mergers

*Brooklyn Edison Stockholders Approve Merger with Consolidated Gas—Small Utility Companies Change Hands—Municipal Plant Sales Referred to Voters*

STOCKHOLDERS of the Brooklyn Edison Company on June 15 signified their approval of the coming merger of the company with the Consolidated Gas Company (see ELECTRICAL WORLD for May 19, page 1033) by depositing more stock with the National City Bank of New York than was necessary to carry out the first part of the plan. Stockholders of the Consolidated Gas Company will vote on the proposal July 16.

Permission from the Public Service Commission of New York to the Syracuse Lighting Company to acquire all of the outstanding capital stock of the Seneca River Power Company and to merge that company with the Syracuse company has been granted. The Seneca River company has operated in Baldwinsville and the territory surrounding that village, which is near Syracuse.

A. A. Lowe of New York, holder of a large tract in the Adirondacks, has a 30-day option on the municipal light and power plant at Old Forge, in that section, and it is expected that he will take up the option.

The Connecticut Public Utilities Commission has approved the plan of the Connecticut Power Company to take over the Union Light & Power Company of Unionville, Conn.

Purchase by the Duke Power Company of five small utilities in North Carolina—the Caldwell Power Company of Lenoir, the Bradley Electric Company of Lenoir, the County Service Company of Lenoir, the Catawba Valley Light & Power Company of Morganton and the Burke Utilities Company of Morganton—is announced. It is said that about $1,500,000 was involved, although no generating plant forms part of the properties. Decision whether to sell to the Duke Power Company the lighting system of Huntersville, N. C., will be made by the voters on June 30.

The Mississippi Power Company has taken over the electric light system of Flora, Miss.

After three years of agitation, during which two municipal elections were held to determine whether the citizens of Charleston, Miss., wanted to dispose of their light and water plants, both defeating the proposed sale, their disposal has been settled and the Mississippi Power & Light Company will take them over for $125,000, after another election which is regarded as a mere formality shall have been held.

The City Council of Pavo, Ga., has passed an ordinance authorizing the sale of the electric light and water plant to the Georgia Power & Light Company for the sum of $30,000. Final consummation of the sale is deferred until July 1, within which time registered voters of the town may protest the sale. If 20 per cent of the registered voters do so, the matter will be disposed of by a vote of the townspeople.

An offer of $800,000 for the municipal light and water plant of Lafayette, La., by the Gulf States Utilities Company is reported. This is the second proposal made. One from the Gulf Public Service Company is to be submitted to taxpayers at a special election set for July 6.

An application to buy the electric light and power plant at Iberia, Mo., to be operated by a new company to be known as the Citizens' Electric Company, has been filed by promoters of the Citizens' Public Service Company, recently organized in Missouri.

The Lexington (Ky.) Utilities Company is reported negotiating for purchase of the Georgetown (Ky.) Water, Gas & Electric Company.

The Kentucky Utilities Company, Louisville, an Insull property, announces that through purchase on June 1 of the Kentucky holdings of the General Power & Light Company of New York it has come into possession of transmission and distribution lines in the towns of Calhoun, Corydon, Rumsey, Poole, Slaughters and Sebree, Ky. Power for this district will be supplied by the company from its generating plants at Earlington and Graham, Ky., as soon as a 15-mile stretch of 33,000-volt line can be constructed.

An offer of $44,000 has been made by the Missouri Edison Company for the power plant and waterworks system of La Grange, Mo.

In orders recently approved by the Indiana Public Service Commission the Southeastern Indiana Power Company of Indianapolis, of which Charles T. Dehore of Ohio is head, was declared a public utility and authorized to buy the Evans Electric Company for $8,288, the Suburban Light & Power Company for $30,215 and the Eastern Light & Power Company for $14,733. These properties are in Marion, Johnson, Shelby and Fayette Counties and adjacent territories. The Southeastern company has applied for permission to issue $1,200,000 in securities, in three groups of $600,000, $400,000 and $200,000, to purchase the Indianapolis & Connersville Light & Power Company, the Milroy Light & Power Company, Battle Ground Light & Power Company, Evans Electric Company and the Indianapolis & Southwestern Railroad Company.

Arrangements by which the Interstate Public Service Company will purchase the property of the Elizabethtown (Ind.) Light & Power Company have been made by stockholders.

The Greencastle (Ind.) Gas & Electric Company has been purchased by the Midland Utilities Company from J. Gordon Martin of LaPorte and associates.

An election has been called by the Town Council of Aurelia, Iowa, to vote on selling to the Iowa Public Service Company the city's electric plant and equipment and the transmission line to Cherokee.

The California-Oregon Power Company, whose operating field extends to within 40 miles of Lakeview, in southeast Oregon, has advised the council of that city that negotiations are under way for the purchase outright of the properties which now belong to the People's California Hydro-Electric Corporation in Lake County or entering a contract whereby the California-Oregon will complete the 40-mile extension and furnish energy wholesale to the other concern.

## No Consolidation of Boston Edison and N. E. Power

Regarding current rumors that a consolidation of the New England Power Association and the Edison Electric Illuminating Company of Boston is contemplated, President F. D. Comerford of the former said this week that no foundation exists for these reports. "What is expected," he said, "is a consummation of arrangements now in progress for a general interchange of power between the two companies in order that the power facilities of each may be available to the other. This should result in operating economies and benefit the public served by both."

As announced under "News About Men of the Industry," Charles L. Edgar, president of the Boston Edison company, has just been elected chairman of the board of directors of the New England Power Association—to which fact the rumors alluded to probably owed their persistence.

## Arkwright at Pasadena

*President-Elect of Parent Body Addresses Pacific Coast Division on Service and Citizenship—Worth-While Speeches Conclude Sessions*

THURSDAY and Friday sessions of the Pasadena convention of the Pacific Coast Electrical Association last week maintained the interest aroused by the earlier sessions and reported June 16 on page 1306. "The Rising Tide of Taxation" and "Putting a Soul Into the Corporation" were the subjects of addresses on Thursday morning. A. C. Joy maintained that advertising should not be defensive, explanatory or historical, because the people are not greatly interested in these aspects of the business, but rather in the comfort, convenience and service that electricity will bring to them and the price which they must pay.

At the public policy meeting in the evening P. S. Arkwright, president-elect of the N.E.L.A., took as his subject "A Citizen Wherever We Serve" and showed how through carrying service to prospective customers instead of waiting for them to make the first move, and through industrial development programs and good citizenship on the part of the corporation and its employees in the community, the industry can merit public confidence and support and fortify itself against public attack. R. H. Ballard, the chairman of the meetings, said that the electrical industry is under national attack because of its power in the fields of engineering and finance and that it must make itself so sound commercially that it will not be vulnerable to attack nor fear the invasion of government in its realm.

On Friday morning Clyde Chamblin, president of the Association of Electragists International, said that contractors and dealers are looking to the central-station companies to lead the way in establishing a sales policy so sound that it will rally the support of the entire industry. If central stations would take half the money they now spend to create good public relations outside the industry and spend it within the industry to create better trade relations, far more would be accomplished than under present policies, he declared. C. T. Hutchinson of the California Electrical Bureau reported substantial progress for the "Red Seal" movement in California.

The closing session was devoted to the affairs of the national association.

with President-Elect Arkwright presiding. C. E. Greenwood, national commercial director, asked the sympathetic support of the geographic divisions and at the same time pledged national support to regional activities. He described the plan of the sales conference group to start an industry load-building program based on a marketing survey to be made by one of the largest business development agencies in the country. Research—the study of the consumer's psychology and reaction to the uses of electricity—and the formulation of a selling plan with common-sense appeal would, with good team work, accomplish what other industries have done. A. Jackson Marshall, national secretary, told of the national organization set-up and how the association functions through its committees.

## "Z" Canyon Project Gets Preliminary Permit

*Federal Power Commission Also Gives Final License to Savannah River 120,000-Hp. Development — Applications Pending for a Number of Streams*

A PRELIMINARY permit was issued by the Federal Power Commission on June 14 to Hugh L. Cooper for his project in "Z" Canyon on the Clark Fork of the Columbia River in Washington. About 200,000 hp. of primary power will be made available by this development. The power is to be used for commercial and public utility purposes.

The commission also has issued a final license to the Savannah River Power Company covering its development on the Savannah River above Augusta, Ga. It is planned to install 120,000 hp. at that point.

A license has been issued to the Bedford Pulp & Paper Company covering a 1,300-hp. project on the James River below Balcony Falls, Va.

Another important interconnection between two large systems is made possible by a license just issued for a 77-mile transmission line which will connect the Prospect No. 2 plant of the Pacific Gas & Electric Company with the Copco No. 2 plant of the California-Oregon Power Company. This is the second connection between these two systems.

The Alabama Power Company has requested the termination of its license covering proposed plants No. 1, No. 2 and No. 3 on the Tallapoosa River. It is understood that the decision to abandon these plants above the Cherokee Bluffs development, which it had been authorized to construct, was influenced by the increasing obstacles in the path of water-power development. The state tax on water power was an important feature. The accounting regulations of the Federal Power Commission constituted another barrier. These and other difficulties are not encountered to the same extent in the development of power by steam. For that reason the Alabama company is turning more and more to the use of steam.

The commission has approved termination of the preliminary permit issued June 16, 1926, to Ray K. Holland of Ann Arbor, Mich. The permit covered a project on Fox River in Illinois. The permittee reached the conclusion after his investigation that it would be impossible to develop water power at a cost which would allow it to compete with steam power in that vicinity.

The commission has taken formal action approving the assignment and conveyance of the rights of the Hydraulic Race Company for the diversion of 275 sec.-ft. from the New York Barge Canal to the Niagara Falls Power Company.

The Virginia-Carolina Power Company of Richmond, Va., has applied for a preliminary permit covering a project on the Roanoke River, near Boydton, Va. It is planned to construct a dam 35 ft. high, creating a reservoir with a surface area of 3,500 acres, and to install 50,000 hp.

Charles H. Lee and Romaine W. Myers, of San Francisco and Oakland, Calif., respectively, have applied for a preliminary permit covering the construction of three plants in Josephine County, Ore., on Rogue River. These plants are designated as Nos. 3, 4 and 5, applications for plants Nos. 1 and 2 having already been received. The power is to be used for public utility purposes.

The Kentucky Utilities Company of Louisville has applied for a license covering a proposed project on Kentucky River in Mercer, Woodford, Franklin and Owen Counties, Ky. It is intended to construct power houses at United States dams and locks 4, 5, 6 and 3 and to utilize the head available at such dams. These developments are to be connected by transmission lines with the existing system of the applicant and that of the Kentucky Hydro-Electric Company. The water to be taken is estimated at 11,280 sec.-ft.

S. B. Collins of Denver, Colo., has applied for a preliminary permit to cover a project on Clear Creek in Hinsdale and Mineral Counties, Colo. The development is to divert water by tunnel from the creek to a power house with 400 hp. installed capacity. The power is to be used for mills and domestic purposes.

## Gardiner Wins Nomination for Governor of Maine

William Tudor Gardiner, candidate for the Republican nomination as Governor of Maine and a believer in the exportation of hydro-electric power beyond the state boundaries, provided that there shall be "proper protection to the state," received a decisive majority over the combined votes of three opponents in primaries held this week. Mr. Gardiner has advocated a referendum on the state water-power question. Governor Brewster, who has opposed any change in the law, sought the nomination for Senator and was badly defeated by the incumbent, Senator Hale.

## Power Commission Licenses Are Halted

### New Order Aims to Prevent Further Accumulation of Unaudited Accounts—Insufficient Personnel the Cause Given for Radical Move

AN ORDER which is expected to halt action on water-power licenses for an indefinite period was adopted by the Federal Power Commission at a recent meeting. In the past, the commission was told, the staff has had difficulty in procuring satisfactory statements of capital accounts in accord with its accounting regulations and procedure. A considerable portion of the difficulty has been associated with expenditures prior to the issuance of the license. Apparently the new order will limit the commission's work to the issuance of the preliminary permits and the granting of transmission-line and other minor licenses.

The full text of the commission's order is as follows:

ORDER No. 27.—In pursuance of the findings of the Federal Power Commission made at its meeting of May 28, 1928, namely: "That the work of the commission relating to auditing of the accounts of its licensees and to the valuation of properties which were constructed at the time license was issued is seriously in arrears and must remain so until a more adequate personnel is available for the performance of this work, and that under such circumstances it is desirable to limit as far as practicable any further accumulation of unsettled cases affecting questions of accounting and of valuation," and by authority of subsections (a), (f), (g) and (h) of Section 4 of the federal water-power act:

It is hereby ordered that from and after the date hereof no application for license, or for amendment of license which adds to the property subject thereto, shall, except in case of emergency or in cases coming within the scope of Subsection (i) of Section 10 of the federal water-power act, be presented to the commission for its approval unless and until agreement has been reached with the applicant with respect to the valuation under Section 23 of said act, in cases where the provisions of said section are applicable, of the property or properties affected by such application for license or for amendment of license, or, if such section is not applicable, with respect to the amount which, under the provisions of said act and of the rules and regulations of the commission, may, as of some definite date, properly be included in the fixed-capital accounts of the project or projects covered by such application for license or for amendment of license; and

It is further ordered that all preliminary permits hereafter issued shall contain a requirement that the permittee shall, with its application for license, submit under oath a statement in triplicate showing the items and amounts and the total amount claimed by the applicant as the actual legitimate cost of and the actual legitimate investment in said project as applied for as of the date of such application or as of a date not more than thirty days prior thereto. Such statement shall include all items and amounts properly chargeable in whole or in part to the fixed-capital accounts of said project under the provisions of said act and of the regulations of the commission established thereunder, whether consisting of expenditures actually made, of charges accrued, or of liabilities or obligations incurred up to and including the date of such statement; and each of such items and amounts shall be supported by satisfactory evidence and shall show the nature of the service performed or of the property acquired or to be acquired, or of the charge or proposed charge, and whether such items or amounts have been actually paid or actually accrued or represent liabilities or obligations under contract, agreement or otherwise applicable to the period prior to the date of such statement.

## Georgia Electrical Men Argue About Merchandising

The Georgia Electrical Association held its annual meeting at Savannah, Ga., on June 15 and 16, with central-station, manufacturing, contracting, jobbing and dealer interests represented in its registration, approximating sixty. President Charles Ludwig of Dublin was in charge of the convention. The principal addresses were made by Gordon Groover, vice-president Citizens' and Southern National Bank, Savannah; R. A. Clark, General Electric Supply Corporation, Atlanta; J. E. Mellett, J. M. Clayton Company, Atlanta, and Marshall Adams, merchandising division of the Westinghouse Electric & Manufacturing Company, Atlanta.

The meeting was somewhat enlivened by the remarks of S. M. Byck, contractor of Savannah, in the discussion of Mr. Mellett's paper, "The Contractors' Viewpoint," when he asserted that the central-station companies should be compelled to refrain from their merchandising and wiring activities, which were taking away the livelihood of the contractors. Central-station merchandising practices were defended by power-company representatives, who held that the central station had been forced into merchandising for the sake of service to its customers and to provide a market for its product and that the power companies had no desire to handle wiring work when reliable contractor facilities were available.

A noonday shore dinner, an afternoon golf tournament and an evening banquet were the entertainment features of the meeting. Deep-sea fishing on the day following the convention was enjoyed by many of the delegates.

The following officers were elected for the coming fiscal year: President, W. W. Barr, Georgia Power Company, Dublin; vice-president, T. W. Moore, General Electric Company, Atlanta; secretary-treasurer, J. J. McDonough, Mutual Light & Water Company, Brunswick.

## Broad Program Furthered

*Industry Sales Conference, Through Its Sales Plan Committee, Undertakes a Study of the Market and the Development of an Industry Selling Plan*

IN FURTHERING its work of developing a selling program for all branches of the industry, the Electrical Industry Sales Conference, through its sales plan committee, has engaged marketing counsel to undertake immediately a research into all consumer and industry factors governing the market for adequate wiring in the home. Out of the facts obtained will be built a co-operative selling plan for early presentation to the industry. The sales plan committee selected as such counsel the J. Walter Thompson Company of New York, Chicago, Boston, Cincinnati and San Francisco. J. E. Davidson (chairman), G. E. Cullinan (vice-chairman), W. E. Sprackling, L. W. Davis, J. E. North and J. L. Ray compose the sales plan committee, which is also to function as the working contact committee through the study and development of the selling plan.

The problem of increasing the effectiveness of the house-wiring contractor is being considered as the subject of a special program for industry action and is not within the scope of the work assigned to the agency, although, of course, the house-wiring contractor will be one of the elements to be considered in the development of the main selling plan. The scope of the work for which the agency is engaged is thus stated:

1. Approaching the problem with the attitude of fundamental analysis, the necessary investigation is to be made which will provide a clear understanding of the market to be influenced, geographically and psychologically, with regard to this problem, as a basis of definite knowledge on which to proceed. This investigation will refer to the present objectives of the conference, as distinguished from a broader investigation of the whole marketing situation of the industry.

2. Interpret the findings of this investigation in the light of broad merchandising experience and with an outside viewpoint.

3. Prepare a comprehensive all-industry selling program founded on the conclusions reached and composed of two parts, viz.: (a) A complete and self-contained localized selling plan, suited to successful promotion and operation in any community. This would be designed as a local co-operative plan, with participation by the electric utility, jobber, contractor, dealer and manufacturer's local representatives. (b) A national phase to give a national background of advertising and publicity and to provide the bond for tying the local programs into a national movement.

It is expected that the program will be built around a new and effective approach that will grip public imagination.

4. Develop an effective plan for presenting the main selling program to the electrical industry in a way to secure the necessary financial support and participation throughout the country. The industry's existing national and local facilities would, of course, be counted on to perform their proper functions.

Funds for the preliminary investigation and development of plan have been made available by the national associations. The conference is handling the business arrangements through the board of directors of the Society for Electrical Development, and members of the staff are assisting the sales plan committee and the agency in their work.

## Saluda River Dam Rapidly Getting Under Way

THE great dam to be erected on the Saluda River in South Carolina by the Lexington Water Power Company, work on which is approaching "full blast," is expected almost to transform the industrial situation in that state. It has already changed the aspect of the country up and down the Saluda River for 30 miles. One thousand farmers will have to vacate their homes. Already thousands of acres of land have been cleared of timber, and a thousand men employed by the Arundel Corporation of Baltimore, the contractor, are at work under the engineering supervision of Murray & Flood.

The dam will be 8,000 ft. in length and 208 ft. high. The lake will be 32 miles long by 14 wide. When the elevation of the lake is sufficiently high, 200,000 hp. will be available in a 60-ft. draw-down. The General Gas & Electric Company of New York has the financial responsibility for the plant.

# Briefer News

New Officers for Vermont Electrical Association.—At the annual meeting of the Vermont Electrical Association, held this month, the following officers were elected: President, A. W. Peterson, St. Albans; first vice-president, W. H. Lawson, Rutland; second vice-president, L. A. Bill, St. Johnsbury; secretary-treasurer, L. E. Merrow, Montpelier.

Power for Idaho Mines.—Opening of the new electrolytic smelter of the Sullivan Mining Company at Kellogg, Idaho, about July 1 will require from 10,000 hp. to 12,000 hp. from the lines of the Washington Water Power Company of Spokane. This plant will be doubled in size in the future, according to announced plans. The smelter is owned jointly by the Bunker Hill and the Hecla mining interests.

Electrical Progress at Syracuse.—Plans for the development of a five-year program for the removal of poles and light, power and telephone cables in the congested district of Syracuse were formulated at a recent meeting at the City Hall. Removal of poles and wire has already been started in several streets by the Syracuse Lighting Company, and the New York State Railways has agreed to place some of its high-tension cables underground. The New York Central Railroad will be electrified through Syracuse, according to information received there.

Last Water Mill on Roanoke to Go.—The last water mill operating on the Roanoke River will pass with the construction of the dam and electric power house for which the Virginia-Carolina Power Company awaits a permit. This is Boyd's Mill, in Mecklenburg County, constructed in 1837 and in continuous operation ever since. During the war between the states it was operated day and night to supply flour and meal to the Confederate forces. With its wing dam and its 1,500-ft. canal, dug by slave labor, it has been considered one of the state's picturesque and historic spots.

Low-Dam Development Near Gouverneur, N. Y., Is Being Pushed.—Two hundred men are pushing work on the Eel Weir power dam a mile downstream from the outlet of Black Lake, near Gouverneur, N. Y. The plant will be in operation by October if expectations are realized. It is being erected by the St. Lawrence Valley Power Corporation and will be interconnected with the lines of the St. Lawrence County Utilities and the power distributed throughout the northern counties where the company already operates lines. The dam will be of the Ambursen type, 14 ft. high, and will have a crest length of 750 ft. The power house, which will be 117 ft. long, will be built in the bed of the river as an extension of the dam proper. The installed capacity will be 3,300 hp. in three General Electric units. A transmission line will be constructed from the power house directly to the company's power house in Ogdensburg.

Western Society of Engineers Has New Home.—The annual dinner of the Western Society of Engineers in Chicago on June 13 celebrated the removal of the society into its new and larger quarters in the recently completed Engineering Building at 205 Wacker Drive. Nearly a thousand engineers were present at the dinner and listened to a program in which all of the national engineering societies were represented. The incoming president of the society, John A. Garcia, and the other new officers were introduced to the assemblage after the retiring president, Rufus W. Putnam, had reviewed the year past.

Law Aimed at Further Hydro-Electric Plants on Four Rivers Is Proposed in Oregon.—An initiative measure which has for its purpose the establishment of fish reservations on four of Oregon's most important water-power resources will be placed in circulation for signatures soon, according to the Oregon Game Protective Association. The rivers affected will be the Rogue, Deschutes, McKenzie and North Umpqua. If adopted by the voters of the state, this measure may close the four streams in question to further hydro-electric development. It is the object to submit the proposed law to the voters next November.

St. Louis Company Answers Attack on Its New Rates.—The Union Electric Light & Power Company of St. Louis has filed with the Missouri Public Service Commission its reply to the petition of that city for an audit to determine whether there can be a further reduction in its rate schedule. The company's answer is that any reduction in residential rates now would mean that other rates would have to be increased. In reply to the city's contention that the company should not be permitted to set up an annual depreciation charge in excess of $950,000 it is stated that the company has adhered strictly to the rate of depreciation fixed by the state commission.

Southwestern Light & Power Company Finishes Second Loop.—The Southwestern Light & Power Company has finished the second loop of its system in Oklahoma with the completion of the 6,600-volt line from Manitou Junction to Frederick, according to E. R. Ernsberger, president and general manager. The company is now closing the last gap in its third loop, extending from Duncan to Addington. A new line just completed replaces one from Walters to Temple. The line from Waurika to a pump station near Ryan has been completed. Material will be ordered next week for several lines surveys of which are now being made. They are Sayre to Erick, Granite to Willow and Brinkman, and Arapaho to Thomas.

Newcastle, Ind., to Be Tied Into Central Indiana Loop.—The Interstate Public Service Company has started to build a 66,000-volt single-circuit transmission line north and west of Newcastle, Ind. This line, which will be 16 miles long, will be connected with the loop of the Central Indiana Power Company at the Henry County line, thus being able to get energy from Kokomo, Lafayette and Dresser. The cost of the line is put at approximately $84,000, and an addition to the New Castle substation will cost $40,000. Yellow-pine treated poles 45 ft. high with 300-ft. spacing will be used.

Teachers' College, Columbia University, to Have Course on Electricity in the Household.—A three weeks' summer course on electricity and household electrical equipment will be held at Teachers' College, Columbia University, New York City, with the co-operation of the women's committee of the National Electric Light Association and under the direction of Dr. C. J. Lynde, head of the department of physics and household engineering of the college, from July 30 to Aug. 17. Dr. Lynde will lecture daily, with demonstrations on electricity, and nearly two hours each day will be spent in the laboratory testing household electrical equipment.

Municipal Plant Advocated for Paducah, Ky.—An effort to put the city of Paducah, Ky., back into the light and power business is being made by the municipal government, which is now of the commission type. It is planning to submit to the voters in the fall a proposed bond issue for $1,000,000 with this end in view. The old power company in Paducah was purchased by the Kentucky Utilities Company in December, 1925, at which time the property was badly run down. Since that time the Kentucky Utilities has spent $615,474 on electrical equipment within the city, having virtually rebuilt the entire system. Electric rates in Paducah are today 15 per cent less than in 1914 and 29 per cent less than in 1921. Agitators for a public plant, however, think the rates should be still lower. The company is making liberal use of the advertising columns of the local newspapers in defense of its service.

Great Western Power Breaks Ground for New San Francisco Plant.—The Great Western Power Company of California has broken ground for its new 35,000-kw. steam generating plant on San Francisco Bay. The plant, which will cost $3,500,000 and will take a year in building, is to be the first unit of a development which will ultimately have a generating capacity of 140,000 kw. Its location is in the southern part of the city, close to its most rapidly developing industrial section. The plant is needed primarily for standby and emergency service. The first unit will increase the steam generating capacity of Great Western to 66,400 kw. and the total hydro and steam capacity to 249,400 kw.

**Electrical Extension for Bradford, England.**—The Corporation of Bradford, England, has determined to install a new 30,000-kw. steam-electric plant at a cost of $1,650,000. Steam pressure of 1,100 lb. will be employed.

**Progress on Great Northern Electrification.**—The new Great Northern Railroad track substation at Cashmere, Wash., one of three being installed between Wenatchee and the Cascade Tunnel to aid the electrification, is progressing rapidly. Similar stations will be built at New Leavenworth and Winton, and at Wenatchee, Cascade Tunnel, Scenic and Skykomish stations are now in operation. They will be used for stepping down the transmission voltage of 44,000 to the trolley voltage. When the line has been electrified the Puget Sound Power & Light Company will furnish electricity at Wenatchee, Skykomish and Tumwater. A 13,200-volt, single-phase, 25-cycle primary signal circuit is also being installed. It is expected that the transmission lines and substations will be completed by Sept. 15.

**Potomac Electric Power Company to Erect Office Building in Downtown Washington.**—As the government's project for the beautification of the Mall requires the purchase of the property at present occupied by the executive offices of the Washington Railway & Electric Company and the Potomac Electric Power Company, these companies have acquired a tract in the downtown business section for a new office and sales building of the best type. Moving will involve a considerable task, officers of the company point out, because most of the feeder conduits from the Benning power plant run into the present office building. No decision has been reached regarding the disposal of the substation that adjoins the present building, but it is expected that this will be moved to some other location rather than the site purchased for the new building.

**Utilities' Donation to Johns Hopkins School of Engineering Explained.**—Dr. John B. Whitehead, dean of the Johns Hopkins School of Engineering, has issued a statement explaining the character of the fellowship of $7,500 given the university by the Utilities Research Commission of Illinois and concerning which Baltimore newspapers have made some mystery. The Illinois donor is the creation of railroad and utility companies in which the Insull interests predominate, Dr. Whitehead explained, adding: "The conditions are perfectly clear. The university has entered into an agreement to prosecute an experimental research into the problem of the insulation of high-voltage cables. This is one of the most pressing problems now confronting the engineering profession. The work is to be done under my supervision, and I am receiving no compensation. No textbooks or other material in which the comparative merits of public and private ownership of public utilities are discussed are used in connection with this work. The work is entirely in scientific research as

**Fifteen Ohio Companies File Rural Service Plans.** — The joint committee on rural lines policy which was set up last March at a conference of farm organization representatives and power companies of Ohio has been making a collection of the rates, schedules and rural electrification plans of Ohio power companies. Already the following companies have filed their plans with the committee: Pennsylvania-Ohio Power & Light, Ohio Power, Ohio Utilities, Ohio Edison, Wooster Electric, Southern Ohio Public Service, Cleveland Southwestern Railway & Light, Western Ohio Railway, Lake Shore Power, Toledo Edison, Columbus, Dalaware & Marion Electric, Dayton Power & Light, Southern Ohio Electric, Suburban Power and Ohio Public Service.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

American Institute of Electrical Engineers—Cosmopolitan Hotel, Denver, June 25-29; Pacific Coast convention, Spokane, Wash., Aug. 28-31. F. L. Hutchinson, 33 West 39th St., New York.

Association of Iron and Steel Electrical Engineers—Hotel Stevens, Chicago, June 25-28. J. F. Kelly, Empire Bldg., Pittsburgh.

American Society for Testing Materials — Chalfonte-Haddon Hall, Atlantic City, N. J., June 25-29. C. L. Warwick, 1315 Spruce Street, Philadelphia.

Society for the Promotion of Engineering Education—University of North Carolina, Chapel Hill, N. C., June 26-29. F. L. Bishop, University of Pittsburgh, Pittsburgh.

Empire State Gas and Electric Association—Commercial Section, Hotel Utica, Utica, N. Y., June 28 and 29. C. H. B. Chapin, Grand Central Terminal, New York.

Michigan Section, N.E.L.A.—Mackinac Island, July 5-7. Herbert Silvester, Edison Bldg., Ann Arbor, Mich.

Public Utilities Advertising Association —Detroit, July 8-12. T. P. Pfeiffer, Byllesby Engineering & Management Corp., Chicago.

East Central Division, N.E.L.A.—Cedar Point, Ohio, July 10-13. D. L. Gaskill, Greenville, Ohio.

National Electric Credit Association—Boston, July 16 and 17. F. P. Vose, 1008 Marquette Bldg., Chicago.

Wisconsin Utilities Association, Electric Section—Appleton, Wis., July 26 and 27. J. N. Cadby, 432 Broadway, Milwaukee.

National Electrical Manufacturers' Association — Policies Division, Association Island, Henderson Harbor, N. Y., July 29-Aug. 1. S. N. Clarkson, 420 Lexington Avenue, New York.

Camp Co-operation VIII—Association Island, Henderson Harbor, N. Y., Aug. 2-7. Society for Electrical Development, 420 Lexington Avenue, New York.

Association of Electragists International—Hotel Stevens, Chicago, Aug. 6-11. L. W. Davis, 15 West 37th St., New York.

**Power Company Sues New York City for Diversion of Its Water Supply.** — An injunction suit and a claim for $750,000 against the city of New York for the alleged diversion of the waters of the Schoharie River have been filed in the Supreme Court of the state by the New York Power & Light Corporation, into which the Adirondack Power & Light Corporation was merged last fall. The power company alleges that the city, by various structures, especially the Gilboa Dam and the Shandaken Tunnel, has diverted the Schoharie from its natural channel and deprived the plaintiff of its right to use its waters. The city asserts its right to the river under legislation authorizing it to condemn lands necessary for its water supply.

**Chippewa Falls Hydro Plant Completed Ahead of Schedule.**—The Chippewa Falls hydro-electric development of the Northern States Power Company went on the line on June 15. Completion of this project, which has been described in previous issues of the Electrical World, was scheduled originally for Sept. 1, but in January of this year it was deemed advisable to advance the completion date to July 1 owing to an increased demand for service. Exceptional construction progress made possible because of good weather conditions permitted this date to be anticipated by two weeks. The new hydro-electric station will provide an additional 27,000 hp. for the Northern States Power Company's Wisconsin division. It will operate synchronously with the 42,000-hp. station at Wissota.

**Artificial Lightning at 1,500,000 Volts to Be Produced at Stanford University.**—Artificial flashes of lightning at a potential of 1,500,000 volts, produced by an impulse generator of the type first developed by F. W. Peek of the General Electric Company several years ago, will soon be available in the Harris J. Ryan high-voltage laboratory of Stanford University in California. The generator, which is an arrangement of capacitor and resistor units, will be the first high-voltage unit to employ cable-type capacitors in place of the glass-plate type formerly used in these generators. It will be connected to the 2,000,000-volt, 60-cycle testing set put into operation in the Stanford laboratory about a year ago. The impulse voltage produced by the generator will be used in studies of high-tension transmission systems and the lightning protection problems with which they are faced. The new impulse generator was designed and manufactured by the General Electric Company at its Pittsfield plant and is at present undergoing tests at the company's high-voltage laboratory there.

## Zone Rates Undesirable in Complex Territory

In the decision of the Massachusetts Department of Public Utilities establishing a general area-energy rate on the Boston Edison system (ELECTRICAL WORLD, June 16, 1928, page 1305) for residential service, the commission declared itself opposed to the establishment of zone rates under present conditions in that territory and approved the application of the company's promotional rate "B," modified as to terms, to the entire area reached by the company's lines. The Boston company serves about 41 cities and towns ranging in size from the metropolitan center to country villages and farming sections about 30 miles distant. There has lately been more or less talk about the desirability of zone rates, but the company has pursued the policy of uniform rates for residential service all over the 700 square miles of territory which make up its terrain. Discussing this matter, the board said:

We have considered whether a system of zone rates would be more equitable than treating the entire area as one district and whether it could be made effective at this time. In view of the large territory the company serves and the differences in the density of the population in the various communities, a superficial view is likely to lead one to the thought that there ought to be a differential in the price. In the consideration of the zones to be established and the differential to be applied practical difficulties are immediately encountered. The profit derived from a community is not easily, if at all, ascertainable, for the reason that the cost of supplying such a community cannot definitely be ascertained. If the customers in a city were all supplied from substations used to supply them alone, it would be possible to approximate the cost of serving the consumers in that city. This is not so, but even if it were, it would require a very long and expensive study of the cost of that part of the distribution system devoted to the distribution of electricity in each community. The company has developed its business on the basis of charging the same rate to the various customers of the same class without regard to the community in which the customer's premises are located. The distribution system of the company has been developed without regard to city and town lines, treating the area served largely as if it were one city. The rates applicable to the more densely settled portions of the territory could not be lowered without making a substantial increase in the rates in the less densely settled portions. Owing to the manifest difficulties involved in fixing satisfactory zone rates, we think it undesirable at this time to attempt to establish them.

Elsewhere in the finding the commission expressed its belief that it ought not, except in unusual circumstances, to undertake to establish the entire rate structure of any company, as the matter falls largely in the field of management. It found that no material discrimination exists today against any class of customers in the company's rate schedule. Commenting upon the decision, President C. L. Edgar of the Edison company said:

The decision is a sound one. It has adopted the form of rate which we believe is the solution of the residence-rate problem, a form in which the normal lighting requirements are measured by the floor area in the residence and energy used in excess of this small portion is charged for at very much reduced rates. The decision cuts our income a million dollars a year, but nevertheless this will in no way interfere with our dividends or with our depreciation charges. In short, the commission has adopted a sound basis of rate making and one with which we are in entire sympathy. It is a great satisfaction to us and will be a distinct benefit to our small residence customers. It does not, of course, apply to commercial customers.

## Recent Court Decisions

POWER OF COMMISSION TO AMEND ITS RECORDS.—The Supreme Court of Ohio, in Helle vs. Public Utilities Commission, reversed an order of the commission which amended its own records by the insertion of an order *nunc pro tunc* (now for then). The court affirmed the right of the commission to make a *nunc pro tunc* order, but pointed out that such orders had only the province of correcting negligent or accidental omission in the case of an order actually rendered but not recorded and that such an order could not be made to correct a mistake in judgment, as had in the case under review been attempted (161 N.E. 282.)*

OHIO COURT APPROVES THE RULING OUT OF "GOING-CONCERN" VALUE AS AN ITEM IN RATE BASE.—A decision of the Ohio Supreme Court in a suit by the Portsmouth Gas Company against the Public Utilities Commission upheld the latter in a refusal to allow a specific "going-concern" value on the company's property. James W. Huffman, a commission member, says the decision has established a precedent to be followed in at least two important rate cases now before the commission affecting the Ohio Bell Telephone Company and the Logan Gas Company. In the Ohio Bell case the company claims a "going-concern" value of more than $14,000,000. The Portsmouth Gas case will probably be appealed to the United States Supreme Court by the company.

WHERE ADEQUATE SWITCHES ARE PROVIDED NEGLIGENCE CANNOT BE PREDICATED ON ABSENCE OF A PARTICULAR KIND.—Because the Circuit Court of Appeals at Baltimore held it to be proved by testimony that an electric signal maintainer on a railroad killed by electric shock while at work could have avoided the accident in any one of three different ways by using properly the switching apparatus maintained by the company, it refused, in Kreger vs. Baltimore & Ohio Railroad Company, to award damages. The claim of the plaintiff was that the company had been negligent in not providing air-break disconnecting switches rather than fuse cut-outs. The victim's neglect, or his unwarranted ignorance concerning the character of the installation, precluded the claim, which, according to the court, would have been valid had he opened the cut-outs and been injured in so doing. (25 Fed. [2d] 728.)

---

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

## Commission Rulings

"ROOM RATE" AND DEMAND CHARGE.—The municipal corporation of Aledo, Ill., complained to the Illinois Commerce Commission against the rates of the Illinois Northern Utilities Company. The commission overruled the complaint and defended the "room rate" of the company, saying that such a basis of electric rates permits of the recognition of the demand feature in a rate schedule without having the effect of penalizing the consumer for the installation of extra or additional sockets and outlets, thereby encouraging the increased use of energy. The room basis, the commission observed, differentiates between the small and the large domestic consumers and permits the small householder to earn as good a rate as the large householder, a condition not easily attained under other forms of rate. It is, on the whole, favorable to the consumer, fair to the utility and just and reasonable in application. The fact that the rates of an electric company are not the same in all of the different communities served by it over transmission lines does not, the decision went on, necessarily indicate discrimination between localities. It cannot be inferred that an optional rate established in one part of the total territory served should be annulled from the mere fact that the rate is not available to the other communities served by the company.

RULES LAID DOWN TO GOVERN COMPETITION.—Adjudicating complaints made by the Public Service Company of Colorado against the city of Loveland, which owns and operates a municipal plant, the Colorado Public Utilities Commission enunciated the following principles: (1) No certificate is necessary for the construction of an electrical extension into contiguous territory not already served by another public utility of like character. (2) The failure to ask for a certificate until after an extension is constructed cannot give the utility any greater right thereto than if it had asked before, in view of the premium that would otherwise be put on the violation of the law. (3) A complaint of inadequate service by an existing utility will not be entertained for the first time in a hearing on a complaint against unauthorized competing service. (4) A utility may not single out isolated unserved inhabitants of a territory through which existing competitive service is offered as constituting together unserved territory. (5) A private utility serving four customers in a territory and offering to build other extensions on reasonable terms subject to the authority of the commission is engaged in "service" within a "territory" to the exclusion of competition from a municipal utility without a certificate. The commission held that the case did not turn upon the question whether the extension could be made by the municipal plant without using any more wire or without using a great deal more than would be required by the public utility company if it gave service to the consumers in question, but upon the question whether the territory in which the customers in question are was "theretofore served" by the private company. A public utility company complaining against an unauthorized invasion of its territory by a municipal plant is not required to show any damage or interference with it.

# News About Men of the Industry

### *A. W. Thompson New Vice-President of N.E.L.A.*

Arthur W. Thompson, who was elected a vice-president of the National Electric Light Association at the recent convention in Atlantic City, has been prominently connected with public utility activities for a number of years and at the present time is president of the United Gas Improvement Company as well as chairman of the board of the Philadelphia Electric Company, acquired early this year by U.G.I. interests. His training as an educator, engineer and railroad executive eminently qualified him for service in a highly industrialized territory, and when he became president of the Philadelphia Company and its affiliated corporations in 1919 he took an active part in all developments undertaken in the Pittsburgh district.

*A. W. Thompson*

Mr. Thompson was born at Erie, Pa., in 1875 and was educated at Allegheny College, Meadville, Pa. Before completing his college course he started his railroad experience and continued to engage in that phase of public utility work until he removed to Pittsburgh. He was identified with the Baltimore & Ohio Railroad for eighteen years and during the war he was made federal manager of several large Eastern railroads. It was due to Mr. Thompson's persistent efforts that the great Colfax power plant of the Duquesne Light Company was erected to anticipate the electric power needs of the Pittsburgh district and to provide abundant cheap electric power. In addition to his affiliation with the National Electric Light Association, Mr. Thompson is a member of the American Electric Railway Association, the American Society of Civil Engineers and of other technical societies.

---

**W. R. Smith** and **P. H. Adams**, assistant chief engineer and electrical engineer respectively of the Public Service Production Company, Newark, N. J., were among those awarded the honorary degree of electrical engineer by Clemson Agricultural and Mechanical College of South Carolina. The degrees were conferred on June 4, 1928, in connection with the dedication of the Riggs Memorial Engineering Building. Mr. Smith and Mr. Adams were both graduated from Clemson in 1906.

**Nicholas F. Brady**, president of the New York Edison Company, arrived in New York June 19 aboard the White Star liner *Majestic* after a short sojourn abroad.

**Maxwell Sauer** has resigned as chief engineer of the William Hamilton Company, Ltd., Peterboro, Ont., and has joined the Winnipeg Hydro-Electric System as designing engineer. Before affiliating himself with the William Hamilton Company, about two years ago, Mr. Sauer was designing engineer of the hydraulic department, Ontario Hydro-Electric Power Commission.

**William H. Onken, Jr.**, editor of the Electrical World, sailed for Europe June 22 aboard the White Star liner *Majestic* to attend as a representative of the American Institute of Electrical Engineers the dedication of the Louvain Library and Engineers' Memorial in Belgium, to be held July 4. From July 5 to July 10 Mr. Onken will be in Paris, where, as a representative of the National Electric Light Association, he will attend the convention of Union Internationale des Producteurs et Distributeurs D'Energie Electrique. Later he will visit Italy and Germany, investigating superpower and hydro-electric developments in those countries. After leaving the Continent Mr. Onken will visit Great Britain to investigate superpower developments there and to study the extent to which American capital has been used in public utility developments in that country and throughout Europe.

**George C. Daniels** was appointed mechanical engineer of the Commonwealth Power Corporation of Michigan to succeed H. F. Eddy, resigned. Mr. Daniels entered the employ of the Central Illinois Light Company, one of the Hodenpyl Hardy companies, in 1910 as engineer, where he remained for four years engaging in engineering, operating and construction in connection with steam power plants. After serving as superintendent of power plants for the Central Light Company and mechanical engineer of the Central Illinois Light Company he was appointed mechanical engineer for the Hodenpyl Hardy Company, in which position he was responsible for the design, construction and operation of the steam plants of the Central Illinois Light Company, the Ohio Edison Company, the Southern Indiana Gas & Electric Company and the Illinois Power Company. He has been connected with the mechanical engineering department of the Commonwealth Power Corporation of Michigan since 1925.

### *W. A. Brackenridge Resigns*

William Algernon Brackenridge, senior vice-president and a director of the Southern California Edison Company, has resigned. In the course of his engineering career Mr. Brackenridge has been identified with some of the most important water-power developments in the United States and since 1909 he has been an officer and director of the Los Angeles utility. In that year he was named vice-president and general manager of the company, which position he held until his election to the presidency in 1918. He served in that capacity until 1920 and at the time of his resignation was occupying the position of senior vice-president.

*W. A. Brackenridge*

Following the completion of his technical education in 1877 he was engaged in an engineering capacity on the rapid transit system in New York City and later he spent some time abroad in an investigation of engineering works in England, France, Germany and Switzerland. Upon his return he was engaged by the Railroad Commission of Connecticut to make plans and surveys. After serving on the board of consulting engineers then making plans for the development of water power at Niagara Falls by the Niagara Falls Power Company, he was appointed engineer in charge of all construction for that company. In 1904 he was appointed by the Governor of New York to the advisory board of consulting engineers in charge of the construction of the Barge Canal connecting the Hudson River with the Great Lakes. During these engagements he conducted a private practice as consulting engineer, specializing on water-power development. Mr. Brackenridge will continue to serve the Southern California Edison Company in an advisory capacity.

---

**J. P. Van de Voort**, assistant general counsel of the American Gas & Electric Company, has been elected vice-president. Mr. Van de Voort is a graduate of the University of Alabama and practiced law in Tuscaloosa until 1917, when he joined the legal staff of the American Gas & Electric Company, specializing in mortgages and contracts for the interchange of power between subsidiary and other companies.

## *Edgar Heads New England Power Association Board*

Charles L. Edgar, president of the Edison Electric Illuminating Company of Boston, has been elected chairman of the board of directors of the New England Power Association, succeeding F. L. Carlisle, resigned. In announcing this change Tuesday, F. D. Comerford, president of the association, stated that Mr. Edgar has been a director of the New England Power organization for several years, and said further: "He has been an acknowledged leader in the electrical industry for many years and no one is more familiar with the problems with which the industry is concerned. His knowledge of these problems and long experience in directing the Boston Edison will be of great value to the association."

H. R. Bowie has been appointed auditor of the Pennsylvania-Ohio Power & Light Company and Pennsylvania Power Company and auditor and secretary of associated companies of the Penn-Ohio System to succeed F. E. Wilkin, who resigned to join the staff of Stevens & Wood, Inc. Mr. Bowie has been assistant auditor of the Penn-Ohio System for the last nine years.

D. J. Kennelly, who for the past six years has been superintendent of electrical construction for the Southern California Edison Company, has been transferred to the newly created position of superintendent of transmission substation operation. Mr. Kennelly joined the Southern California Edison Company in 1913 and has held successively the positions of job foreman, electrical inspector, construction department and superintendent of electrical construction.

H. F. Eddy, mechanical engineer of the Commonwealth Power Corporation of Michigan, has resigned to enter the research department of the Foster-Wheeler Corporation of New York. Mr. Eddy's identification with the Commonwealth Power Corporation and affiliated companies dates back to 1910, when the present Consumers Power Company was known as the Commonwealth Power Company. At first his work was of a general engineering nature, but later he specialized in mechanical engineering, assisting J. B. Foote in the design of the Flint, Grand Rapids, Kalamazoo and Battle Creek stations. For a period of years he was with the production and transmission department of the Consumers Power Company with duties of an operating and construction nature. When the Grand Rapids heating plant and the Saginaw River steam plant were built he became associated with the engineering force, remaining with that division until his resignation.

## *J. F. Owens Becomes Vice-President of N.E.L.A.*

J. F. Owens, who was elected a vice-president of the National Electric Light Association at the recent convention in Atlantic City, as announced in the June 9 issue of the Electrical World, has been vice-president and general manager of the Oklahoma Gas & Electric Company for the past ten years. His renown, however, is not bounded by the State of Oklahoma, for today he is recognized nationally as one of the most beloved and capable of the executives of the light and power industry. Congenial and sympathetic by nature, he promptly established organization morale through his personal interest in the company's employees, and on this foundation he built an enviable record in the way of public relations. Outside of the electrical world Mr. Owens has an unusually wide acquaintance among representative business men of Oklahoma, having been called upon to serve in every civic campaign of importance.

*J. F. Owens*

Mr. Owens was born in Aurora, Ill., and was educated at the Kansas State University. Before becoming vice-president and general manager of the Oklahoma Gas & Electric Company in 1918 he had been identified with utility properties at Baldwin, Kan., and at Wagoner and Muskogee, Okla. He is a past-president of the Oklahoma Utilities Association, past-president of the Southwestern Division of the National Electric Light Association and during the past year served as chairman of the Public Relations National Section.

E. Lovette West, president of the W. S. Barstow Management Association, Inc., and for many years prominently identified with public utility interests in the East, has been elected a director of the General Gas & Electric Corporation, New York, to succeed Joseph B. Taylor.

Ernest E. Blair has been appointed purchasing agent of the Central Maine Power Company, succeeding the late Blaine Owen. Mr. Blair has been in the employ of the company since 1912 and has been acting purchasing agent since July, 1927. His headquarters will be at Augusta, Me.

V. P. Griffin, combustion engineer in the power stations department of the Duquesne Light Company since 1923, has been appointed mechanical operating engineer, supervising the operation of power station mechanical equipment.

## Obituary

Albert Stetson, patent attorney, who was prominently identified with the Edison interests in England, France and this country, died June 7 at his home in Brooklyn, N. Y. While attending Tufts College Mr. Stetson became associated with Professor Dolbear, one of the early workers in telephony, and this connection was continued following graduation, taking him abroad for an extended period for scientific study. He affiliated himself with the Edison interests in Europe and spent much time in Paris and London in their employ in the early '80s. Largely as the result of this work he subsequently became a confidential expert in electrical and metallurgical matters for Grosvenor P. Lowery, of Lowery, Stone & Auerbach of New York, who was one of the counsel for the Edison interests up to the time of his death.

William T. Holmes, vice-president of the Monitor Controller Company, Baltimore, Md., died at his residence in that city June 9. Mr. Holmes was born in Philadelphia 51 years ago and had been associated with the Monitor Controller Company interests for about 25 years. For the last ten years he was vice-president of the company. Mr. Holmes was well known as a control engineer. He participated especially in the development and application of current limit control and time limit control systems which were organized by the Monitor Controller Company. His mind was particularly apt and keen in the analysis of control problems in the field—in shops and plants where electric motor control had to be applied in particular ways to accomplish specific results.

Joseph K. Choate, consulting engineer of New York, died June 19 in San Francisco of pneumonia after an illness of three days. Mr. Choate conducted an active consulting practice and since 1913 had been engaged in the management of public utility properties, particularly those of the J. G. White Management Corporation, of which he was a vice-president and director when he resigned early this year. Early in his career he did some engineering work for the New York City Department of Public Works and later engaged in railroad engineering. During his connection with the White organization he served as vice-president and director of the Augusta-Aiken Railway & Electric Corporation, director of the Georgia-Carolina Power Company and vice-president and director of the Helena Light & Railway Company.

# Financial and Statistical News

## *Power Stocks Recover Refunding Operations Heavy*

POWER and light stocks have shown their stability during the past week by a tendency to withstand the general selling movement after the liquidation of two weeks ago. With the beginning of the heavy selling which took place early in June, utility prices receded with the rest, but the downward trend seems to have halted much sooner than in most other groups. During the current week stocks such as American Gas & Electric, Pacific Gas & Electric, Detroit Edison, Middle West Utilities, Columbia Gas & Electric, etc., actually showed marginal gains, while the general market average was moving downward.

Refunding operations continue to require the great bulk of capital being currently secured by power and light companies. For the first five months of the year to date, out of some $734,000,000 raised for all purposes through public sales, refunding operations required 78 per cent. This indicates a slackening off in new building and construction programs.

## Westinghouse Electric Elects New Director

At the annual meeting of stockholders of the Westinghouse Electric & Manufacturing Company held in the company's East Pittsburgh headquarters June 13 the election of four directors to serve for the term ending 1932 and a modification of the by-laws were the chief items of business transacted. Charles A. Terry, a vice-president of the company, was elected to the directorship left vacant by the death of Gen. Guy E. Tripp. The three others upon whom action was taken were re-elected. They were Joseph W. Marsh of the General Cable Company, H. H. Westinghouse of the Westinghouse Air Brake Company and Albert H. Wiggin of the Chase National Bank.

The stockholders ratified a change in the by-laws by which the fiscal year of the company now conforms with the calendar year. Instead of the fiscal year ending March 31 as formerly, it will now end Dec. 31, and the annual meeting of stockholders will be held in the future the second Wednesday in April.

## Electric Investors Issues New Preferred Stock

Electric Investors, Inc., offered an additional issue of $6 preferred stock (no par value), totaling 49,000 shares, the price being 103 a share and accrued dividend, to yield over 5.80 per cent. The proceeds from the sale of this preferred stock provided funds for the retirement on June 1, 1928, of all $7 preferred stock then outstanding, for the acquisition of additional interests in electric light and power companies, and for other corporate purposes.

## April Revenue $153,400,000

### Income and Energy Output Six Per Cent Greater Than in April, 1927—Hydro Generation Breaks Record

WITH a revenue of $153,400,000, operating expenses of $63,200,000 and an energy output of 6,419,112,000 kw.-hr., operations of the electric light and power industry in the United States during April showed an increase of 6.0 per cent in income and virtually the same in production compared with the corresponding month last year, while the cost of operation rose less than 2.5 per cent, according to monthly reports received by the ELECTRICAL WORLD, together with energy statistics compiled by the U. S. Geological Survey.

In each respect the figure is the highest for any April in the history of the industry, although in accordance with the usual seasonal swing both the output and the revenue were smaller than during the winter months, the decrease in the latter amounting to 2.5 per cent compared with March. The rise over the corresponding month of 1927 is somewhat less than in the first three months of the year, particularly March, but this difference is partly offset by the fact that the extra day in February increased the energy consumption by more than 3 per cent, and this excess was necessarily reflected in the bills paid during the following month.

Nevertheless, April operations were close to the estimated normal based on growth in recent years. The average daily revenue was $5,110,000; the normal would have been $5,300,000; the energy averaged 214,000,000 kw.-hr.; the normal was computed to be 215,000,000 kw.-hr. daily.

Output from water power, nearly 2,822,000,000 kw.-hr., was not only the largest ever reported but also constituted the largest fraction of the total output ever reached, 44 per cent. Hydro energy, indeed, made up 80 per cent of the increase over the total output of April, 1927. The balance came from fuel-burning plants. Although the out-

*Data on "energy generated" are those collected and published by the United States Geological Survey for all public utilities minus such data as are collected on energy generated by electric railway companies, reclamation service and manufacturing plants. The data are, therefore, for the electric light and power industry only.
†1928 figures are only approximately comparable with those for 1927, because of changes in classification of certain plants.

put of the latter exceeded that of a year ago, there was a decrease of nearly 160,000 tons in the consumption of coal and a slight decrease in fuel oil, far from counterbalanced by the somewhat greater use of natural gas.

Regional changes in revenue, as indicated by the reports, are as shown in the following table:

REGIONAL CHANGES IN REVENUE

| Region | Per Cent Change From April, 1927 | From March, 1928 |
|---|---|---|
| New England | +4.7 | —5.2 |
| Atlantic | +6.8 | —2.6 |
| North Central | +6.2 | —3.1 |
| South Central | +5.1 | —2.9 |
| Western | +12.0 | —0.4 |

Changes in energy output followed the same general trend; the increase on the Atlantic seaboard was greatest in the southern portion, and a high rate in the West South Central states balanced a lack of increase in the East South Central, while both Mountain and Pacific states in the Western group reported 11 per cent increase over April, 1927.

# General Gas & Electric Corporation Cuts Cost and Simplifies Set-Up

WITH a 4.3 per cent reduction in operating costs for 1927, the General Gas & Electric system was able to show a gain of 8.2 per cent in net operating revenue from an increase of less than 2 per cent in gross revenue. This is one of the few systems which has shown an actual reduction in costs for the year. The corporation itself showed a 25 per cent increase for the year both in gross revenue and in net income. This substantial growth, presumably, is what warranted the inauguration of dividends on the B stock at the rate of $1.50 per share.

The increase in revenue accruing to the parent company resulted in earnings of $5.90 per share on class A common stock. This compares with earnings on A and B stock of $3.43 in 1926 and $1.69 in 1925. Dividends on A stock commenced in October, 1925. Class A stock is currently quoted at around 41 and Class B at around 50.

The reduction in operating costs and maintenance improved the operating ratio of the group very materially, from 58 in 1926 to 54.8 last year. Property investment amounted to $5.85 per dollar of gross revenue, which makes an attractive showing among similar systems.

## ELIMINATES COMPETITIVE SITUATION

In July, 1927, all securities of the North Carolina Public Service Company and the South Carolina Gas & Electric Company, owned by the corporation, and all property owned by the Broad River Power Company in North Carolina and that portion of its property in South Carolina located north and west of Union, S. C., was sold to the Duke Power Company, thereby eliminating a competitive situation which would have been very costly for both interests if continued. Benefits to the General Gas & Electric Corporation of this transaction are steadily accruing, but will not be fully apparent in its earnings until July 31, 1928.

*As collected by United States Geological Survey. The data are for the electric light and power industry only.

Further simplification of the corporate structure of the system was accomplished through the acquisition by the Metropolitan Edison Company of the property of the Metropolitan Power Company and the redemption of the latter's 6 per cent gold bonds. The latter step is part of a general refinancing program in which it is planned to retire all Metropolitan Edison's underlying issues and to replace them with bonds bearing a lower interest rate; also to have the Metropolitan Edison Company acquire the property and franchises of the Pennsylvania Edison Company, its principal subsidiary. This plan has been consummated during 1928.

The corporation closed the year with no bonded or floating debt. Notes payable on the consolidated balance sheet are those of subsidiary companies, which are paid off from time to time through funds obtained from the sale of securities and which represent temporary obligations pending the sale of such securities.

Expansion during the year included the installation of a 30,000-kw. unit at the Johnson City generating station of the Binghamton Light, Heat & Power Company and the completion of an interconnection of its lines with those of the Elmira Railway, Light & Water Company. The Florida Public Service Company constructed a new steam-electric generating station near Avon Park, which is interconnected with the Benson Springs station, placed in operation in 1926.

The General Gas & Electric system as at Dec. 31, 1927, served 224,208 customers. Electric sales for 1927 were 731,347,110 kw. and gas sales totaled 1,028,110,000 cu.ft. Of the operating income of subsidiaries for 1927, 85 per cent was derived from the sale of electricity, 9 per cent from gas and miscellaneous services and 6 per cent from bus and street railways. The physical properties include electric generating stations with total installed capacity of 337,398 kw-hr., approximately one-eighth hydro-electric and seven-eighths steam; also 2,207 miles of transmission lines and 3,592 miles of distribution lines. The gas properties have a 24-hour generating capacity of 9,335,000 cu.ft. and 312 miles of mains.

## Savings Banks Association Advocates Private Operation

At a meeting of the mutual savings bankers of the country held last week at Swampscott, Mass., the passing of legislation in the State of New York making it possible for savings banks to invest approximately $500,000,000 in public utility securities was lauded. The committee on public utilities submitted a report which strongly upheld the principle of private ownership. The report said: "We believe that regulation is infinitely better than public ownership, and such regulation, in our opinion, should include issuance of securities, both bonds and stocks, methods of accounting, and rates to be charged for the service rendered."

The committee on uniform policies and laws submitted a report showing the four classes of property which comprise the bulk of savings banks investment are public funds, railroad bonds, public utility bonds and real estate mortgages. Some recent figures indicate that in 1922 the banks had 24 per cent of their

assets in public funds and only 16.6 per cent in 1927. The investment in railroad bonds decreased from 21 per cent to 15.7 per cent. Public utility investment increased from 7.1 per cent to 12.3 per cent and real estate mortgages increased from 32.9 per cent to 42.1 per cent.

## Chicago Utility to Issue Additional Common Stock

At a meeting to be held Aug. 2, the stockholders of the Public Service Corporation of Northern Illinois will vote on increasing the authorized no-par common stock from 200,000 to 300,000 shares. The additional stock will be offered to common and preferred stock holders at $100 a share to the extent of one share for each five shares held. Proceeds are to be used to reimburse the company's treasury for additions to property already made and to provide funds for projected additions and betterments to the company's property.

TWO HOLDING COMPANIES PAY INITIAL DIVIDENDS ON PREFERRED.—Directors of the American Power & Light Company have declared an initial quarterly dividend of 62½ cents a share on the $5 preferred stock, series A. This issue of preferred stock is entitled to cumulative dividends at the rate of $2.50 a share for the balance of the year 1928, $3 a share during 1929, $3.50 a share during 1930, $4 a share during 1931 and thereafter at the rate of $5 per share annually. This stock was issued to holders of Montana Power Company common stock in the ratio of two preferred shares for each Montana Power common share held. The directors of the American Superpower Corporation have declared an initial quarterly dividend of $1.50 per share on the new $6 cumulative preferred stock (no par value), payable July 2 to holders of record June 15. This stock was recently distributed to the common stock holders in the form of a 20 per cent stock distribution.

PUGET SOUND UTILITY PAYS INITIAL PREFERRED DIVIDEND.—The directors of the Puget Sound Power & Light Company have declared an initial dividend of $1.05 per share on the new $5 cumulative prior preference stock (no par value), payable July 16 to holders of record June 15. The directors also declared the regular quarterly dividend on the $6 preferred.

# Business News and Market Conditions

## Middle Atlantic Shows Increased Construction

*Volume for the United States in 1928 Is 25 per Cent Greater Than for the Same Period of 1927*

DURING the five weeks of May, 1928, engineering construction volume reached a total of $357,059,000. On the basis of average weekly lettings the construction industry showed the same activity as in May, 1927, and was about 5.6 per cent lower than in April of this year, according to the *Engineering News-Record.* The value of contracts awarded this year to date is 25 per cent ahead of last year.

The Middle Atlantic states lead in the percentage increase over the first five months of 1927. This year contracts exceeded those of a year ago in that section by 66 per cent. The South showed a substantial increase of 31 per cent; New England, 18; Middle West, 14, and west of the Mississippi, 2 per cent above a year ago. The far West showed the only decline. Contracts were 12 per cent lower than last year for that section.

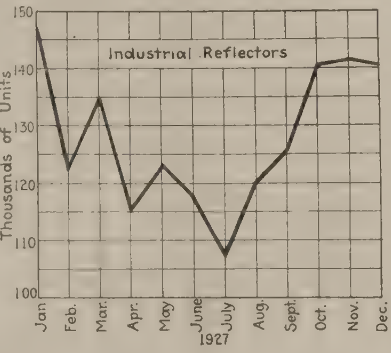
All classes of construction showed larger five-month totals in 1928 except sewers, excavations, federal government and private unclassified work. The outstanding increases in awards were made in streets and roads (62 per cent) and in private commercial buildings (33 per cent). This year is 26 per cent ahead of last for all private construction and public awards are 23 per cent greater than in 1927.

Commercial buildings constitute the largest class of construction as measured by value of contracts; the section in which the greatest expenditures for all construction are made is the Middle Atlantic. Average monthly awards for private commercial buildings in this section in 1928 has been $71,461,000, while the average month for all 1927 was $44,380,000. There is, however, no indication or suggestion of overconstruction in the increasing rapidity with which these large commercial buildings, both residential and commercial, are being built. Rents have been practically unchanged in New York City within the last three years, and there was a continual increase in rents since 1915. Average rents for the whole country have been declining since the high point reached in December, 1924.

Compared with average weekly contract awards in April, 1928, May showed an increase only in New England. Two exceptionally large waterworks contracts in Massachusetts contributed to the total. Very small decreases were shown in the Middle West and west of the Mississippi. The construction volume index number for May was 299. In April it was 312.

Classes of construction for which contract values exceeded the weekly rate a month ago were water-works, bridges, excavations, industrial buildings and federal government work. Two conspicuous bridge awards were the Lake Champlain bridge from Crown Point, N. Y., to Chimney Rock, Vt., and a railroad bridge over Newark Bay. The contract value for the former was $920,177 and the total value of the latter structure will be $7,500,000.

## N.E.M.A. Statistics



*Sales of industrial reflectors in numbers of units*

(Other statistics collected by the National Electrical Manufacturers' Association appeared in previous issues.)

## Markets for Equipment in Western Europe

Exports of electrical machinery from the United States to the whole of Europe were valued at $1,826,900 in 1926 and at $3,047,800 in 1927. Exports to western Europe amounted to $1,501,700 in 1926 and to $2,383,100 in 1927. During the year 1926 the United States exported $84,226,000 worth of electrical apparatus, of which $10,341,440, or 12.26 per cent, went to European countries. A survey of the exports of electrical machinery and apparatus during the four years 1923 to 1926 reveals the fact that an average of 16 per cent of the total found its way to European markets, but our exports of such material to Europe have dropped consistently since those countries have recovered from the loss of trade following the World War. The fact that our total exports of electrical equipment are increasing each year, while exports to Europe are slowly falling off, may be attributed in some degree at least to the fact that a greater effort is being made to develop other markets, such as Latin America, where competition is less keen.

Generally speaking, France, Spain and the United Kingdom are our best European markets for industrial electrical appliances. Rather a large proportion of our exports of accessories and parts for motors go to Belgium and Italy, and even Norway imports a good deal of this equipment, while of our shipments of small motors a large percentage finds its way to Germany. The Netherlands, Sweden, Switzerland, Italy and Belgium also import small motors to a considerable extent. Trade with Russia is steadily improving, exports of industrial electrical appliances to that country for 1925 and 1926 showing a marked gain over the two preceding years.

A survey of the world markets for electrical goods in 1923 shows that Great Britain, the United States and Germany together supplied 80.6 per cent of the world requirements of

*Value of Contracts Let in the United States and Canada During May, 1928*

electrical machinery alone and 78.4 per cent of the requirements of electrical machinery and apparatus combined, the smaller percentage in the latter instance being due to the enormous lamp trade carried on by the Netherlands and the French trade in insulators and cables. The countries entering definitely into the field of international competition are Great Britain, the United States, Germany, Switzerland and Sweden.

The following table gives a comparison of the values of the exports of electrical machinery and apparatus from the five principal industrial countries during the years 1913, 1923 and 1924.

Details of power supply and industrial conditions are given for the fourteen countries comprising western Europe in trade information bulletin No. 547, issued by the electrical equipment division of the Bureau of Foreign and Domestic Commerce, Washington, D. C. In this bulletin reference is made to data published in the ELECTRICAL WORLD that industry in the United States is already electrified to the extent of 65 per cent. In Great Britain, Belgium, Czechoslovakia, Hungary and other countries the degree of electrification is much less. In Germany industry is electrified to the extent of 70 per cent.

VALUE OF EXPORTS OF ELECTRICAL MACHINERY AND APPARATUS FROM LEADING COUNTRIES

| Exported from | 1923 | 1923 | 1924 |
|---|---|---|---|
| United States.. | $28,200,000 | $75,600,000 | $81,000,000 |
| Germany...... | 77,000,000 | 69,300,000 | 69,300,000 |
| Great Britain... | 37,300,000 | 68,800,000 | 75,100,000 |
| France........ | 10,620,000 | 17,250,000 | 22,200,000 |
| Switzerland.... | 6,050,000 | 9,610,000 | 10,240,000 |
| Total...... | $159,170,000 | 240,560,000 | 257,840,000 |

# Market Conditions

SALES of power equipment show an advance in New England. An outstanding order for motors amounted to $11,000. Buying of scheduled material and general supplies is steady. Refrigerating machinery sales are quite active. The volume of sales has been reduced in the Eastern district, but the prospects for increased industrial business are good. Important new plants planned include a power plant for a typewriter manufacturer in New England, at a cost of $300,000; an oil refining plant on Staten Island, to cost $10,000,000; another oil refining plant in Baltimore, at a cost of $1,000,000; additions to a wire plant in New Jersey, amounting to $100,000, and plant extensions by a shock absorber manufacturer in northern New York, amounting to $100,000. Wire and cable sales show a noticeable improvement and transformer orders have increased and are expected to continue at that rate for several weeks.

In the Southeast a large condenser order placed by a Carolina power company amounted to $325,000. An oil circuit breaker order in immediate prospect will amount to $100,000. Industrial plant business is steady. An improved tone is reported in the St. Louis district with an increased demand for motors. Sales continue to improve in the Middle West. Orders placed by a central-station company for boilers, etc., amounted to more than $1,500,000. On the Pacific Coast apparatus sales, despite a 10 per cent increase in pumping motor business, are running somewhat less than those of last year. Distribution transformer business, however, is greater. Orders for equipment for the Northern Life Building in Seattle are placed at a cost of $200,000.

## *Metal Demand Active—Prices Stable*

Non-ferrous metal prices are substantially stable with the exception of tin and silver, which are slightly lower. The demand in general has been good.

NEW YORK METAL MARKET PRICES

| | June 13, 1928 Cents per Pound | June. 20, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic..... | 14.525 | 14.525 |
| Lead, Am. S. & R. price | 6.30 | 6.30 |
| Antimony.............. | 9.75 | 9½ |
| Nickel, ingot........... | 35 | 35 |
| Zinc spots.............. | 6.50 | 6.50 |
| Tin, Straits............ | 48 | 47 |
| Aluminum, 99 per cent... | 24.30 | 24.30 |

Base copper wire price June 20, 1928, 16⅝ cents.

Though many of the copper producers are unwilling sellers, especially for early delivery, no attempt has been made to advance prices over the quotations of last week.

## *Improved Tone Noted in St. Louis District*

Manufacturers report a much-improved tone in business in the St. Louis district. Orders for stock sizes of motors have almost doubled over those of the previous week. One order for motors ranging from 15 hp. to 35 hp. and amounting to $5,000 was placed and a local manufacturing concern purchased $3,000 worth. No large contracts have been closed, but several are being figured. There have been a number of good-sized shipments of transmission line material and a large volume of building materials is being sold. Construction projects are as follows:

The Citizens Electric Company, Hot Springs National Park, Ark., will make extensions in its power plant to cost $90,000. The Page Milk Company, Merrill, Wis., plans a plant a Coffeyville, Kan., to cost $200,000. The Gulf States Utilities Company, Beaumont, Tex., plans extensions in transmission lines, near New Iberia, La. The South Coast Company, Chicago, plans a sugar refining plant at Oaklawn, La., to cost $500,000. The Hillyard Chemical Company, St. Joseph, Mo., plans a plant to cost $100,000. The Gulf, Colorado & Santa Fe Railway, Fort Worth, Tex., plans locomotive repair shops at Saginaw, Tex., to cost $150,000.

The Texas Utilities Company, Plainview, Tex., plans rebuilding of transmission line from Plainview to Lockney, Tex., and extensions to South Plains to cost $90,000. The San Antonio Portland Cement Company, San Antonio, Tex., plans an addition to its power plant in the Lakeview district. The West Texas Utilities Company, Abilene, Tex., plans a 12,000-volt transmission line in Crockett County; and also will extend lines to the Rosser-Pendleton oil field.

## *Sales Volume Reduced in Eastern District*

Actual commitments show a tendency to slacken in the Eastern district. The decline in activity is evidenced both with central station and industrial business. The latter looks favorable for an immediate revival, despite the usual seasonal decrease which is anticipated at this time of the year. A typewriter manufacturer in New England will build a power plant to cost $300,000; an oil refining company has authorized a plant on Staten Island to cost more than $10,000,000, while another company in this same line will build a plant at Baltimore to cost approximately $1,000,000. A wire company in New Jersey has approved an addition to its factory to cost $100,000, while a shock absorber manufacturer in northern New York will build an extension to cost a like sum. Control equipment sales are rather spotty. Cement mills and baking plants, two active outlets in recent weeks, have curtailed their inquiries, although it is believed to be only temporary.

Business in wire and cables shows noticeable improvement. Switching apparatus is operating under a reduced call, especially high-voltage, outdoor type apparatus, and no immediate renewal of demand is anticipated in that line until near the end of the summer season. Fractional-horsepower motor business has been extremely active in recent weeks and, while a temporary lull is evidenced, good sales are anticipated. Orders for transformers show an advance that is expected to last for several weeks. Sales of electric refrigerators are very strong. Construction activities are as follows:

The Northern Westchester Lighting Company, Ossining, N. Y., is building a substation at Ossining, N. Y., to cost $85,000. The Gulf Refining Company, New York, plans a refinery on Staten Island to cost $10,000,000. The Columbia Metal Box Company, New York, will build an addition to cost $100,000. The New York Edison Company, New York, plans a substation on West 56th Street. The Underwood-Elliott Fisher Company, New York, plans a power plant at Hartford, Conn., to cost $300,000.

The duPont Cellophane Company, Buffalo, plans additions to its paper goods mill to cost $200,000. Beach Haven, N. J., plans an addition to its municipal power plant to cost $50,000. The Public Service Electric & Gas Company, Newark, N. J., has purchased 200 acres of land on Staten Island Sound, vicinity of Sewaren, N. J., for a new power plant at a later date. The H. F. Runkel Bakery, Elizabeth, N. J., plans a baking plant to cost $350,000 (this project was incorrectly attributed to the Ward Baking Company in these columns last week). The American Copper Products Company, Elizabeth, N. J., will build an addition to its wire-manufacturing plant to cost $100,000. The Radio Tube Company, Newark, N. J., will build an addition to cost $70,000. Harrisburg, Pa., will make extensions in its lighting system with the installation of 600-cp. units. The Youngstown Sheet & Tube Company, Youngstown, Ohio, will install a coal-washing plant at Nemacolin, Pa., to cost $600,000. The Asiatic Petroleum Company, New York, has acquired property at Baltimore, Md., for a proposed refining unit, to cost $1,000,000.

## *Sales Continue to Improve in Middle West*

Business in most sections of the Middle West continues to show improvement and indications point to a continuation of this condition during the coming months. Reports from manufacturers of agricultural implements indicate an increase in the demand for farm machinery. Industrial activity is increasing and the steel and railroad industries continue to show improvement. Important orders placed by utility companies include three boilers complete with appurtenances valued at $1,000,000, labor and material to build foundations for a coal reclaiming structure valued at $60,000, a heating and ventilating system valued at $40,000, labor and material for erecting flues, uptakes, air ducts and appurtenances valued at $115,000, one 300-kw. electric mule complete with appurtenances and "Mazda" lamps valued at $90,000. Construction projects are as follows:

The Commonwealth Edison Company, Chicago, plans an addition to substation on Lake Street. The Illinois Steel Company, Joliet, Ill., is planning expansions to cost $200,000. The Delco-Remy Corporation, Anderson, Ind., plans an addition to its starting and lighting equipment plant to cost $100,000. The Electric Shovel Coal Corporation, Clinton, Ind., plans an electric mining plant and tipple at Winslow, Ind., to cost about $100,000. The Marshalltown Trowel Company, Marshalltown, Iowa, plans an addition to cost $120,000.

The Municipal Utilities Company, Des Moines, Iowa, plans a power plant at Missouri Valley, Iowa, to cost $225,000. The Briggs Manufacturing Company, Detroit, plans an addition to its automobile body plant, to cost $500,000. The Michigan Public Service Company, Ludington, Mich., has acquired the Antrim Light & Power Company, Mancelona, Mich. The Fisher Body Corporation, Pontiac, Mich., plans an addition to cost $1,000,000. The Ohio Electric Power Company, Sidney, Ohio, plans an automatic power substation at its Mill Road plant, Ravenna, Ohio, to cost $50,000. The Minnesota Power & Light Company, Duluth, Minn., will make extensions in transmission lines near Duluth, Minn.

The Nebraska Power Company, Omaha, Neb., plans extensions in transmission lines near Omaha, Neb., to cost $350,000. The Otter Tail Power Company, Fergus Falls, Minn., plans extensions in transmission lines near Montpelier, N. D. The Central West Public Service Company, Omaha, Neb., will build a transmission line from Edmore to Lakota, N. D. The Northern States Power Company, Eau Clair, Wis., plans extensions in transmission lines at Summer, Wis. The Wisconsin Power & Light Company, Madison, Wis., will build a 66,000-volt transmission line in the Iron River district, Mich., and the Wisconsin Lake territory, about 70 miles to cost $250,000. Lake Forest, Ill., Marquette, Mich. and Coleraine and Mankato, Minn., plan ornamental lighting systems.

## *Apparatus Sales to Date Below Last Year on Pacific Coast*

Apparatus and machinery sales on the Pacific Coast, despite a 10 per cent increase in pumping motor business, are running somewhat less than those of last year. The exception is distribution transformers. One manufacturer reports transformer orders aggregating 400 units during the past week with an upward trend. Orders for equipment for the Alameda Estuary tube have amounted to $34,000. An electrical contract for the Capwell department store in Oakland has been let at a cost of $165,000 to the Nepage-McKenny Company. Power company purchases have included $4,500 worth of hardware and also a carload of bolts and screws, two carloads of poles and four 1,667-kva. transformers for the Modesto irrigation district. Interesting industrial orders include a dynamometer equipment for $6,000 for testing gas engines, two motion-picture motor-generator sets at $2,500 each, a 125-hp. synchronous motor valued at $2,700 for a cement plant and three 200-kva. transformers amounting to $3,500 for a steel plant. Street-lighting projects and orders are many and total $62,000.

An average week of motor and apparatus sales involving about 80 machines, from 30 hp. down, for irrigation, orchards, cold storage plants and lumber mill replacements, was reported in the Puget Sound district. An order for equipment for the Northern Life Building in Seattle amounted to $200,000. The city of Seattle has authorized the reconstruction of the Cedar Falls transmission line No. 1 by increasing the size of the conductors and installing new wire at a cost of approximately $100,000. Proposed industrial projects are as follows:

A cold storage plant at Wenatchee, Wash., to cost $60,000. A milk evaporating plant at Sunnyside, Wash., to cost $50,000. A cold storage plant at Clarkston, Wash., to cost $80,000. A large addition to the Fidalgo Pulp and Paper mill at Anacortes, Wash. A 22,000-volt line extension from Reedsport to Coosbay, costing $40,000. The superintendent of the U. S. Indian School at Phoenix, Ariz., is asking bids until July 10 for seven motors. The Los Angeles Compress & Warehouse Company, Los Angeles, plans an addition to cost $500,000. The Modesto irrigation district, Modesto, Calif., will receive bids until July 2 for high-voltage power transformers, 1,667 kva., outdoor type (Specifications No. E-11).

The Pacific Gas & Electric Company, San Francisco, has approved a fund of $278,000 for a substation at San Jose, Calif. The Great Western Power Company, San Francisco, will build a steam power plant at South San Francisco to cost $3,000,000. The West Stanislaus irrigation district, Westley, Calif., is asking bids until July 14 for seventeen electric-operated pumping units, six outdoor switching stations, and eighteen transformers. The Pacific Lighting Corporation, San Francisco, will make extensions in systems at Beaumont, Hemet and San Jacinto, Calif., to cost $50,000. The Astoria Box & Paper Company, Astoria, Ore., plans a pulp mill to cost $400,000. Ellensburg, Wash., will soon take bids for extensions to the municipal power plant, for which a fund of $35,000 has been approved. The Seattle Pulp & Paper Mills, Inc., Seattle, Wash., plans a mill to cost $1,000,000, including a power plant.

## *Power Equipment Sales Advanced in New England*

Motor sales and control equipment orders have increased in New England. An outstanding order for a number of motors, amounting to about $11,000, was received, as well as an order for twelve motors for a complete installation for a paper mill. One manufacturer reports a number of interesting group orders for small motors. No let-down in the buying of scheduled materials and general supplies by central-station companies is apparent. Orders for small switches, watt-hour meters and power control equipment were numerous. A line material order totaling four carloads was reported. Refrigerating machinery sales are quite active. The demand for electric heating furnaces is continuing, with encouraging prospects of little abatement this season as compared with other years. Construction projects are as follows:

The Ames Shovel & Plow Company, North Easton, Mass., will build a new plant. The People's Hydro-Electric Vermont Corporation plans a development on the Green River to cost $163,000. The Farrell Foundry & Machine Company, Waterbury, Conn., will build an addition to cost $100,000. Boston, Mass., will expend $125,000 for a traffic control system. The Bureau of Supplies and Accounts, Washington, D. C., will receive bids until July 3 for electric pumps and spare parts for Boston navy yard and other yards (Schedule 9261). The American Writing Paper Company, Holyoke, Mass., will make extensions in its mill to cost $500,000. The Public Electric Light Company, St. Albans, Vt., plans extensions in its plants to cost $40,000.

## *Large Condenser Order Placed in Southeast*

The outstanding order placed in the Southeast was by a Carolina power company for condensers for two 60,000-kw. turbines, amounting to $325,000. An oil circuit breaker order approximating $100,000 is in immediate prospect in another section of the territory. A power company in Mississippi ordered power transformers amounting to $30,000, while copper wire orders of a Georgia company totaled in excess of $15,000. Other central-station orders included $3,500 worth of distribution transformers, $2,200 worth of bushings and insulators, $2,400 in small switching equipment and $1,500 in creosoted pine poles.

Engineering contracts have been let on a paper mill to be constructed in Alabama and wiring materials amounting to $40,000 will be used. An order was placed for motors, switchboards and lighting transformers amounting to $40,000 for textile mill units being moved from the East to Alabama. Another textile plant in the same state placed an order for a 1,500-kw. turbine. Electric welders were ordered by two small iron works in Georgia. A town in Georgia let a contract for 113 additional "whiteway" standards. Another municipality ordered one carload of creosoted pine poles, while a third purchased wiring materials amounting to $500 for use in its fire alarm system. An order for $2,500 worth of wiring materials for a hotel job in south Georgia was placed by a contractor. Construction projects are as follows:

The Gulf Utilities Company, New Port Richey, Fla., has acquired the Cedar Keys Light & Power Company, Cedar Keys, Fla. The Florida Public Service Company, Orlando, Fla., is arranging for the purchase of the municipal power plant at Mount Dora, Fla. The Mississippi Power & Light Company, Jackson, Miss., is arranging a fund of $350,000 for 110,000-volt transmission line. The Duke Power Company, Charlotte, N. C., has acquired utilities in Lenoir and Morganton, N. C. The Capital Granite Company, Oxford, N. C., will build an electric-operated stone-crushing plant at Blairs, S. C., to cost $100,000. Mobile, Ala., plans an ornamental lighting system to cost $200,000.

# Activities of the Trade

## Brown Boveri Plans Sale of Part of Holdings

A special meeting of holders of founders' stock has been called by the American Brown Boveri Electric Corporation for June 25 at the office of the corporation, 420 Lexington Avenue, New York, for the purpose of voting and taking action on the sale of the entire stockholdings in the Moloney Electric Company, St. Louis. In a letter to its stockholders the company states that the sale is for cash and is recommended by the board of directors in view of present conditions in the industry and as the corporation may itself now engage in transformer manufacture at space already available for that purpose at its Camden, N. J., plant, thus avoiding duplication. The Moloney holdings will be sold to Stifel, Nicolaus & Company of St. Louis. There also will be submitted at the same meeting of holders of founders' stock the proposed sale of its shipbuilding business at Camden, a matter which the management has had under consideration for some time, believing the best interests of the corporation indicate that its activities be concentrated upon its electrical business alone. The sale will include that part of the plant known as the "North Yard" and parts of the "South Yard" particularly involved in shipbuilding. The consideration proposed is cash under circumstances that will insure the retirement of the present bond issue and a cash balance in addition. If approved by the stockholders the sale will be made as soon as the proposed purchaser can complete his financing.

W. M. Flook, chairman of the board of directors of the company, in commenting on the proposed sale to a representative of the Electrical World, said that it will put the company in a stronger and better position than ever before. If the sale of these two holdings is approved by the holders of founders' stock the subsidiaries of the Brown Boveri corporation will consist of the Condit Electric Manufacturing Corporation of Boston and the Scintilla Magneto Company of Sidney, N. Y.

## Robbins & Myers Company Reorganizes

Robbins & Myers, Inc., Springfield, Ohio, successor to the Robbins & Myers Company, manufacturer of electric motors, generators and fans, announces the purchase of all of the assets of the Robbins & Myers Company, including the Robbins & Myers Company of Canada, Ltd., from W. J. Myers, receiver. The new company states that it is in a position better to serve its customers than ever before, with ample working capital amounting to over $2,000,000 in quick assets and less than $50,000 of accounts payable. The capital structure of the new company will consist of 100,920 shares of $25 par value 6 per cent preferred stock and 151,380 shares of no-par common authorized.

The officers of Robbins & Myers, Inc., are W. S. Quinlan, president; C. A. Stirling, vice-president and general sales manager; O. C. Burmeister, secretary; H. I. Smeltzer, treasurer, and W. M. Mumma, fan sales manager. All of the above have been connected with the old Robbins & Myers Company and no change in personnel is contemplated. It is understood that Wilbur J. Myers will become permanently identified with the new company as one of the principal executives as soon as he is relieved of his duties as receiver.

---

The Wheeler Insulated Wire Company, Bridgeport, Conn., manufacturer of lamp cords and fixture wires, announces the appointment of the Burg Electric Sales Company, 32 Union Square, New York City, with a branch office at 1321 Arch Street, Philadelphia, as selling agent in the territories covered.

The Combustion Engineering Corporation, International Building, 200 Madison Avenue, New York City, announces the appointment of James Cleary as general sales manager. Since associating himself with the company in 1921, Mr. Cleary has been district manager of the Philadelphia and Detroit offices and for the past two years has been assistant general sales manager.

The Edwin L. Wiegand Company, 422 First Avenue, Pittsburgh, manufacturer of electrical heating units, announces that George Bray & Company, Leeds, England, have purchased the rights to the "Chromalox" line of heating units for Great Britain and other European countries. George Bray & Company are manufacturers of ceramic products, especially refractories for gas burners and electric heating units of the open coil type, and will manufacture the "Chromalox" products in their own plant at Leeds.

The James R. Kearney Corporation, 4224 Clayton Avenue, St. Louis, manufacturer of overhead and underground utility equipment, announces a price reduction on solderless service connectors and guy wire clips. The company also announces the manufacturing of the Kearney "Hi-tension," four-in-one expansion anchors made in four sizes.

The Hoover Company, North Canton, Ohio, manufacturer of vacuum cleaners, announces that it has placed on the market a new model 972, heavy-duty electric cleaner which is said to have a very large dirt-removing capacity. The company also announces that it is now equipping Hoover models 700, 543 and 972 with a new cord-strain-relief plug made of bakelite,

The Welsbach Street Lighting Company of America, the Welsbach Electric Street Lighting Company and the Pennsylvania Globe Company announce the removal of their general offices to 261 North Broad Street, Philadelphia, Pa.

The Mogadore Insulator Company, Mogadore, Ohio, manufacturer of electrical porcelain, announces the removal into its new factory at Akron, Ohio, and a change of its name to the Akron Porcelain Company. There has been no change in the personnel or status of the company.

# New Equipment Available

## Three-Element Watt-Hour Meter

The type OB three-element watt-hour meter has been placed on the market by the Westinghouse Electric & Manufacturing Company. This meter is designed primarily for use on three-phase, four-wire circuits where a high degree of accuracy in measurement is desired. In construction the meter consists essentially of three single-phase elements placed one above the other, having all three disks mounted on a common shaft. The torques of all three elements are totalized and the energy measured on one register. The elements each have adjustable power-factor loops and are fully compensated for variations in temperature. The entire meter element is a unit assembly and can be removed from the case without affecting the calibration. The meters are made for either house type or switchboard mounting.

## Dynamic Balancing Machine

An improved model of the Olsen-Lundgren centrifugal dynamic balancing machine has been placed on the market by the Tinius Olsen Testing Machine Company, Philadelphia. The supports for the rotor to be balanced are of the ball-bearing roller type and are provided with a ball-bearing support so that each bearing may oscillate freely to obtain correct alignment in supporting the rotor. A new type of coupling also has been developed, incorporating a ball-bearing universal joint instead of the former driving pins. This arrangement has the advantage that any ordinary misalignment between the spindle and the piece tested does not interfere with the accuracy of the reading.

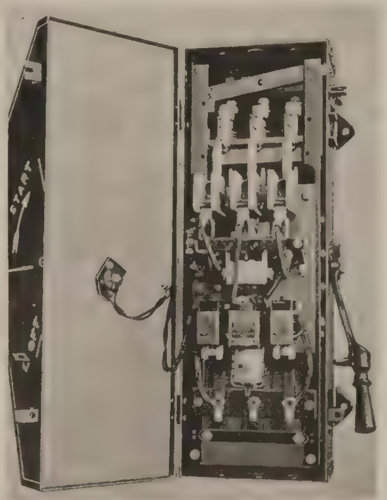
The rotor being tested can be quickly disengaged from the adapter and the time required to mount the part to be balanced is also reduced to a few seconds. The supports for the rollers can be readily adjusted to various lengths. Each one is provided with a quick-locking mechanism to facilitate taking the reading of unbalance at either bearing, so that the one support will be entirely free from the other in taking the readings.

To transfer the amount of unbalance and angle as shown by the machine so that corrections may be made at any two points along the length of the rotor, an entirely new transfer instrument has been developed. The correct reading of the amount of unbalance in ounce-inches, and the angular plane of unbalance required at selected points of correction from readings taken at the bearing support are readily obtained through simple adjustment. Where work is of a production character the settings are simplified further.

The improved dynamic balancing machine is available in any desired size suitable for balancing very small rotors of ½ lb. in weight up to the largest size turbine rotors. It is made to suit different lengths and classes of work and any special graduation other than ounce-inches can also be furnished on the dial and instrument. The wiring of the machine is entirely self-contained, and is piped so that no additional outside wiring is required.

## Combined Resistance and Transformer Starter

The "Resisto-Transformer" starter, which is said to combine the features of both the primary resistance starter and the auto-transformer for reducing the starting current taken from the line, has been developed by the Allen-Bradley Company, Milwaukee. The transformer is connected to the line through graphite compression resistors, the resistance of which is gradually reduced until the motor starts. The transformer, which up to this point has been connected in open delta, is disconnected at the common point, leaving the motor connected to the line through the graphite compression resistors and the impedance of the transformer. The next step connects the motor through the running switch to the line and the final step disconnects the transformer altogether from the line. The manufacturer states that the second current inrush is limited to a value which can do no harm to the line voltage because the motor is not disconnected when switched to line voltage. The company claims that it is possible with this new starter to install squirrel-cage motors on power lines which otherwise could not handle them without costly additions in line and transformer capacity to prevent voltage fluctuations.



*Motor starter combining the primary resistance and auto-transformer principles*

## Control for Automatic Arc Welding

An improvement in the control equipment used with its automatic arc welding heads, by means of which the feed of the electrode wire is stopped a short time before shutting off the welding current at the end of the weld, has been developed by the General Electric Company. This is said to clear the electrode from the weld and to fill in the crater which is inevitably left at the end of the weld when the arc is cut off short. According to the manufacturer, it is always desirable to have the electrode clear of the weld when removing the work from the clamping fixture, to prevent the end of the wire from dragging. This is of particular importance with large sizes of wire. Many users of arc welding also want to eliminate the undesirable crater, as they find its presence is objectionable, especially on circular welds of small diameters where one end of the weld is lapped over on the other end.

The General Electric control panel for its automatic arc welding heads is controlled by a push-button station. Mounted on the panel are a line contactor of suitable size for the welding current, an arc voltage regulating relay, a relay for controlling the travel motor and a time delay relay for clearing the electrode from the weld. The rheostats for controlling the arc voltage and the speed of the electrode motor are mounted on the outside of the sheet metal inclosing case. A small meter panel is used for indicating the arc voltage and welding current.

Plating Tank Rheostat.—An improved type of plating tank rheostat, known as the "Optimus," has been developed by the Hanson-Van Winkle-Munning Company, Matawan, N. J. These rheostats are said to afford absolute regulation and control of plating baths. It enables the electroplater to adjust the total resistance of a plating tank circuit so as to regulate the current density in the plating bath itself.

Railway Signal Choke Coils.—A new choke coil, recommended for use with all high-voltage lightning arresters when used for the protection of transformers on railway signal high-voltage power lines, is announced by the General Electric Company. This choke coil is designed for location between the arresters and the apparatus to be protected, so that an incoming surge will first meet the arrester and then the choke coil. As the current requirements in such service are unusually small, it was found possible to utilize galvanized iron wire as the conductor in the coil without sacrificing efficiency.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued May 29, 1928)

1,671,236. Toy Railroad-Track Switch; A. H. Gill, West Haven, Conn. App. filed March 16, 1927.

1,671,245. Alternating-Current Rectifier; F. Kraus, Rodenkirchen, near Cologne, Germany. App. filed April 15, 1926. Using a tuned spring set in synchronous vibration by an alternating current magnet.

1,671,247. Current Rectifier; L. Levy, Paris, France. App. filed Oct. 28, 1925. For wireless telegraphy and telephony and other analogous uses.

1,671,262. Submarine Sound Reception; R. L. Williams, Newton, Mass. App. filed April 2, 1925.

1,671,269. Electric Switch; C. W. Bassett, Maplewood, N. J. App. filed Oct. 31, 1923. Rapid make and break.

1,671,294. Switch; L. Kellner, Chicago, Ill: App. filed April 27, 1925. Snap switch for lighting circuits.

1,671,300. Electrical Heating Apparatus; A. S. Macdonald, Great Neck, N. Y. App. filed May 17, 1923. Treating small objects such as steel balls for bearings.

1,671,335. Storage-Battery Separator and Process of Producing the Same; T. A. Willard, Cleveland Heights, Ohio. App. filed May 28, 1921.

1,671,337. Soaking Pit; T. F. Baily, Alliance, Ohio. App. filed March 5, 1925. A soaking pit or furnace adapted to receive ingots or other articles to be heated in spaced upright position, the heating elements being located above the upper ends of the ingots whereby the heat is radiated downward.

1,671,344. Soldering Implement; C. M. Chapman, Terryville, Conn. App. filed March 25, 1926.

1,671,378. Electric Heater; F. D. Pitt, Kansas City, Mo. App. filed June 7, 1926. Bowl radiating type.

1,671,379. Rotary Switch; R. K. Winning, Milwaukee, Wis. App. filed July 16, 1924.

1,671,394. Electric Heater; E. E. Anderson, Kansas City, Mo. App. filed March 2, 1925. Bowl type.

1,671,401. Extruded Depolarizing Bobbin; A. J. Briggs, Syracuse, N. Y. App. filed Mar. 31, 1922. For electric cells.

1,671,407. Connecter for Use in Charging Batteries; A. O. Codney, Cleveland, Ohio. App. filed Dec. 18, 1925.

1,671,417. Welding Rod; R. Franks, Elmhurst, N. Y. App. filed Jan. 21, 1926.

1,671,451. Electric Vacuum Furnace; M. D. Sarbey, Cleveland, Ohio. App. filed Dec. 1, 1925.

1,671,461. Electric Vacuum Furnace; G. D. Bagley, Great Neck, N. Y. App. filed April 28, 1927.

1,671,463. Water-Wheel Regulator; C. A. Boddie, Pittsburgh, Pa. App. filed Nov. 26, 1924.

1,671,469. Electric Resistance; G. Egly, Berlin-Treptow, Germany. App. filed March 31, 1925. Terminal connection for resistor rods.

1,671,471. Circuit Interrupter; C. LeG. Fortescue, Pittsburgh, Pa. App. filed Jan. 3, 1920. Quick-acting.

1,671,473. Electrical Instrument; M. Jacobson, Camden, N. J. App. filed July 9, 1924. With increased sensitivity.

1,671,488. Induction Motor; R. Rüdenberg, Charlottenburg, near Berlin, Germany. App. filed May 11, 1917. With increased starting torque while retaining good constant-speed characteristics and low starting current.

1,671,514. Control System; R. C. Deale and N. Marcalus, Plainfield, N. J. App. filed July 16, 1924. For operating machine tools.

1,671,533. Brush Holder for Electric Motors; J. Lindall, Boston, Mass. App. filed Jan. 21, 1927.

1,671,538. Pothead or Electric Distributing Box; E. W. McIntyre, Cleveland, Ohio. App. filed March 11, 1927.

1,671,550. Safety-Latch Split Electrical Plug; E. H. Semmens, Seattle, Wash. App. filed April 30, 1927.

1,671,566. Dry Battery; A. T. Baldwin, Montclair, N. J. App. filed May 31, 1923.

1,671,568. Heating and Cooling Device for Buildings; A. H. Barker, Westminster, London, England. App. filed Nov. 23, 1926.

1,671,584. Electric Heating System; W. W. Hicks, San Francisco, Calif. App. filed May 10, 1926.

1,671,591, 1,671,592. Electric Heater; A. J. Kercher, Berkeley, and W. W. Hicks, San Francisco, Calif. Apps. filed March 10, 1924, and Dec. 17, 1925.

1,671,593. Temperature-Control System; A. J. Kercher, Berkeley, and W. W. Hicks, San Francisco, Calif. App. filed March 5, 1927.

1,671,615. Electric Switch; H. A. Spahr, Milwaukee, Wis. App. filed Nov. 24, 1926. For elevator use; actuated by a cam.

1,671,622. Box and Method of Manufacture Thereof; W. A. Wilcox, Seattle, Wash. App. filed Sept. 8, 1925.

1,671,640. Electrical Attachment Device; W. F. Hendry, Ossining, N. Y. App. filed Jan. 7, 1924.

1,671,641. Controlling Electric Machines; H. S. Holmes, New York, N. Y. App. filed March 21, 1925. For electric resistance welding.

1,671,659. Means for Protecting Aerial Cables; T. Varney, Sewickley, Pa. App. filed Feb. 25, 1927.

1,671,742. Electric Kiln; T. C. Prouty and W. O. Prouty, Hermosa Beach, Calif. App. filed June 27, 1927.

1,671,767. Support for Outlet Boxes and the Like; J. Kozelka, Cleveland, Ohio. App. filed Jan. 2, 1926.

1,671,794. Resistor and Support Therefor; D. L. Summey, Waterbury, Conn. App. filed June 5, 1926.

1,671,799. Brake-Controlled Circuit Closer; G. J. Warndorf, Cincinnati, Ohio. App. filed Feb. 18, 1926.

1,671,805. Projector Lamp; P. R. Bassett, Brooklyn, N. Y. App. filed Nov. 25, 1922.

1,671,824. Electric Switchboard and Template Structure; J. W. Hooley, Larchmont, N. Y. App. filed Sept. 27, 1927.

1,671,837. Electric Switch; A. H. Nero, New Britain, Conn. App. filed Jan. 30, 1922. For controlling lighting systems.

1,671,839. Inductional Water Heater; F. C. Owen, Fayetteville, N. C. App. filed Oct. 28, 1926.

1,671,842. Battery-Charging Clip or Connecter; G. Schurimann, Seattle, Wash. App. filed Sept. 22, 1926.

1,671,860. Electric Switch; O. Hammerstrom, Bridgeport, Conn. App. filed Nov. 4, 1924. Snap switch mechanism as in a socket.

1,671,905. Electrical Terminal; E. D. McKenna, New York, N. Y. App. filed Oct. 3, 1924.

(Issued June 5, 1928)

1,671,963. Induction Regulator; D. L. Alexander, Chevy Chase, Md. App. filed Oct. 2, 1926.

1,671,965. Electric Switch; G. R. Brown, Croydon, near Sydney, New South Wales, Australia. App. filed Aug. 31, 1926. Pull cord.

1,671,970. Liquid Rectifier; G. W. Carpenter, Palo Alto, Calif. App. filed June 7, 1921.

1,671,979. Wire Splice; W. E. Cook, New York, N. Y. App. filed Nov. 27, 1925. For use during the manufacture of insulated conductor wires.

1,671,985. Thermostatic Switch Control; J. C. Goosmann, Peoria, Ill. App. filed March 3, 1921.

1,671,993. Fuel-Oil Preheating Device; J. T. McTarnahan, Boston, Mass. App. filed Aug. 21, 1922.

1,672,005. Electrical Apparatus; A. J. Sorensen, Wilkinsburg, Pa. App. filed June 25, 1927. Railway signal equipment.

1,672,049. Alternating-Current Relay; M. L. Almquist, Brooklyn, N. Y. App. filed March 29, 1926.

1,672,059. Insulator; W. S. Cook, Parkersburg, W. Va. App. filed Oct. 9, 1923. Pin type insulators.

1,672,067. Grounding Receptacle and Plug; P. F. Labre, Spalding, Mich. App. filed May 12, 1927.

1,672,085. Signal; G. A. Primrose, Oakland, Calif. App. filed March 27, 1922.

1,672,112. Means for Facilitating Starting of Automatic Generating Plants; A. F. Brotz, Kohler, Wis. App. filed Dec. 30, 1921.

1,672,201. Terminal Connecter for Electrical Supply Cables; A. Champion, Flint, Mich. App. filed May 18, 1921.

1,672,219. Switch Receptacle; H. Hubbell, Bridgeport, Conn. App. filed Dec. 30, 1925. For use in wall outlet box.

1,672,221. Electric Hammer; J. Karcevsk, Chicago, Ill. App. filed April 25, 1927.

1,672,261. Fuse; G. Kahn, Chicago, Ill. App. filed Oct. 1, 1927. Renewable plug fuse.

1,672,263. Sectional Switch Box; E. H. Kruse, Fort Wayne, Ind. App. filed March 22, 1923.

1,672,285. Gaseous Conduction Lamp; F. Schaefer, Kalamazoo, Mich. App. filed Aug. 27, 1927.

# New Trade Literature

LAMPHOLDERS.—The General Electric Company, merchandise department, Bridgeport, Conn., is distributing a pamphlet covering a line of new threaded catch "Textolite" lampholders.

BUS SUPPORTS.—The Delta-Star Electric Company, 2400 Block, Fulton Street, Chicago, has issued bulletin No. 31-BA, describing a new line of low-voltage bus supports for voltages from 200 to 4,500.

SWITCHES AND WIRING DEVICES.—The Hart & Hegeman Manufacturing Company, Hartford, Conn., has issued catalog T describing its complete line of "H & H" fine switches and wiring devices. Many illustrations showing the various types of the equipment are included.

STARTERS AND SWITCH. — Bulletins Nos. 111, 112 and 113 issued by the Clark Controller Company, Cleveland, describe respectively the Clark "Three C" primary resistor starters, the Clark "Three C" across-line-type reversing starters and the Clark "Three C" starting switch with disconnect feature. The bulletins contain dimension diagrams and ratings.

CONDUIT FITTINGS. — The Adapti Company, 2996 East 72d Street, Cleveland, has issued catalog No. 107-A, a supplement to catalog No. 107, describing and illustrating the company's new line of Adaptilets, also fixture elbows, plug and base receptacles and self-aligning fixture joints for use with Adapti-lets, Adaptiboxes and all regular standard fittings.

ELECTRIC FANS. — Robbins & Myers, Inc., Springfield, Ohio, is distributing bulletins No. 1386 and No. 1387 describing and illustrating its alternating and direct-current circuit ceiling fans built with lighting units. These fans are especially suited for hotels, office buildings, churches, theaters, restaurants, stores and homes.

DEMAND REGISTER.—Bulletin No. 75 issued by the Sangamo Electric Company, Springfield, Ill., describes and illustrates the Sangamo type HB maximum demand register. The bulletin contains instructions for installing and operating the register, as well as other information in regard to it.

SWITCHBOARD DEVICES.—The General Electric Company, Schenectady, N. Y., is distributing bulletins GEA-924, GEA-938 and GEA-942 covering respectively its bus supports for indoor service, accessories for switchboards and miscellaneous air break switches, plugs and receptacles.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Berlin, Germany (No. 31,534), for motor-driven household electrical appliances, and another (No. 31,537) for household electrical appliances and motor-driven devices.

An agency is desired in Leipzig, Germany (No. 31,530), for electric refrigerators, and another (No. 31,535) for all-metal electric washing machines.

Purchase is desired in Bradford, England (No. 31,527), of electric traffic control devices.

An agency is desired in Dresden, Germany (No. 31,529), for electric washing machines.

An agency is desired in Warsaw, Poland (No. 31,565), for wiring supplies and fixtures.

Purchase is desired in Auga Prieta, Mexico (No. 31,556), of X-ray and electromedical equipment.

An electric power station is being planned to be built at Bohult, about 2 miles from the present junction of the tributary and the main river, and will have a capacity of 100,000 hp. Additional information is avaliable under reference Sweden No. 276,297.

A company is being organized in Oswiecim (Teschen, Silesia) for the utilization of water power on the Sola River. The company's intention is to build a hydro-electric plant which will furnish the current for operating a normal-gage electric railway to be constructed between Oswiecim and Zywiec.

## *The Washington Investigation and the Information Bureaus*

AS THE time draws near when the Federal Trade Commission will conclude its investigation of the various state public utility information bureaus, one cannot but be impressed with the sorry spectacle made in their testimony by these masters of publicity. This has been due primarily to the *ex parte* nature of the hearings and to the manner in which the examinations have been conducted, but the ego and love of exaggeration of the press agent also form part of the story. Unfortunately, the public utility industry is judged by the statements of the most incompetent of these men and the public reaction is anything but good. Distorted though the newspaper accounts may be, they are what reach the public, which in the presentation made can only conclude that it has been imposed on and made the dupe of insincere statements put forth for that end.

Of course, if the complete story of the industry could be told by the men who have been part and parcel of it, a different impression might be created; but we doubt very much whether a chance will be given to the industry to vindicate itself before the Federal Trade Commission. It has already been damned and cast into outer darkness by the scandalmongers, and the public relations work of years has been undone. Does this mean that the utility companies should cease all publicity work? Quite the contrary. The public utilities of the country should double and quadruple their efforts to command public understanding and respect, but information bureaus must hereafter be under stricter executive guidance and direction. That has been made all too plain by developments in Washington.

* * * *

## *Bond Issues Are Withheld from Falling Market*

THE remarkable paucity of public utility bond issues now being offered is due, not to a lack of demand for new capital, but to a well-considered policy on the part of the investment banking fraternity. There is much senior financing to be done, but the present weakness in the bond market apparently demands the policy of postponement which has been adopted.

This time last year the volume of bond debenture financing was unusually large. New financing of this type on the part of power and light companies during April and May alone exceeded $200,000,000. Early in the summer the bond market began to display a downward tendency, but the volume of new issues was not reduced until a rather serious congestion occurred throughout the investment market as a whole. It was some time before shelves were cleared. The bankers and those sponsoring new issues are carefully guarding against a repetition of this situation. There is much refunding still to be done, and this will effect marked economies. It is apparently the consensus of opinion in banking circles, however, that refunding economies may easily be wiped out if too many issues are thrown on the market indiscriminately at a time such as the present.

* * * *

## *Mergers Predicated on Banking and on Service*

BANKERS peering into the future profess to see in the offing business changes as momentous and as far-reaching as any of those already experienced in recent years. Throughout the convention of the American Institute of Banking in Philadelphia last week that note was dominant. Naturally, there was also a feeling of apprehension, for bankers are as a rule conservative; but conservatism did not becloud the picture of the tremendous industrial evolution which every one, including the bankers, knows is taking place in this country. Continued mergers of banking institutions are looked for; but here the bankers, although in step with the general trend of industry, are face to face with the problem confronting executives of utility companies—a dearth of skilled men.

Holding companies in the public utility field are admonished to adopt a plan of "merciless publicity" and a complete willingness to co-operate with public authorities as a safeguard against trouble and public disfavor. For adequate funds with which to carry on their operations holding companies will probably resort to debentures more than ever, and if these are readily absorbed, the electric light and power industry ought to continue unhampered its onward march. Of course, if money were all that were needed to conduct the public utility business—and money is most important—and if mergers could always be relied on to work out as planned or expected, the outlook would be roseate.

But there are other problems just as perplexing as finance. In union there is strength, but very little if it is a union of brass and lead. New holding companies and new investment companies are springing into being very rapidly of late, and unless wisdom and knowledge are displayed in combining or buying into properties, the combinations are bound to come to grips. Mere combination offers no royal road to fame and riches. Weak properties may be kept alive by transfusion with some strong property, but if the property is hopelessly anemic, it is a burden to the strong property and combination will not save it. Bankers are too prone to believe that mere manipulation of shares suffices to effect solidarity.

It will, if the combination is a logical one; but only a seasoned operator of public utilities can tell that. The market of the electric public utility industry is exceedingly bright, but its development must be intrusted to skilled utility men who will not easily be led astray during periods of cheap money. The object of all combinations should be better, or more economic and reliable, service, in keeping with the wants and needs of the community. Operators must never lose sight of that.

* * * *

## *Becoming "System-Minded"*

IT IS essential that the rising generation of electrical engineers regard their daily problems with a broader outlook than in the past. They must become "system-minded"—as they have become "automobile-minded" and are fast becoming "air-minded."

The past generation had to do with small systems, usually comprising one generating plant and a few radial feeders. They were isolated by distance and were developed along individual ideas—often widely divergent. The head of each department was a law unto himself. He had mastered his own duties but usually knew very little else outside his immediate sphere.

The present large systems and the intricate combinations resulting from interconnections of larger systems have introduced many problems which cannot be successfully solved by the old methods. Planning for many years into the future is an absolute necessity if economy and successful operation are to accompany expansion. Each new development in any part of the system, no matter how small, should be made with an eye to its relation with and its influence upon the system as a whole. It should be an efficient link in the chain, not only fulfilling its own immediate purpose but assisting adjacent members to reach the highest state of efficiency.

The men who are in charge of the work, whether planning, installing or operating, must get themselves in the habit of seeing beyond the local problem. They must think and work in terms of the system. They must become "system-minded."

* * * *

## *Evidence of Progress by Industry Sales Conference*

THERE is good news in the announcement that the Industry Sales Conference has retained a prominent advertising agency to assist in the development of the sales program for which electrical men are waiting. That they are waiting expectantly cannot be questioned. It was clearly evidenced at the recent conventions of the manufacturers, the jobbers and the power companies. The contractor-dealers are pinning great hopes upon the conference. For the four branches of the industry have appointed the men considered best for the job and asked them to find together the way to bring about the adequate wiring and equipment of the millions of homes now connected where further sale of electric service is largely blocked by inadequate facilities for the use of appliances. A fund has been provided, principally by the power companies and the manufacturers, to finance the preparatory work.

The conference has wisely sought expert advice. After all, this is not primarily an electrical problem. It is a problem of how to sell in the popular market. Why do the American people spend so small an amount for electrical equipment compared with other modern luxuries and conveniences? That is the question. It will be worth a good deal to have some unprejudiced outsider study this and find the answer, for any large market development by the electrical industry in the homes will have to be achieved through increasing the popularity of electrical appliances in direct competition with the other good things of life. We will have to change the present public attitude toward these relative appeals.

It may be expected that by fall whatever research is necessary will have been completed and that a plan and program will be ready for the consideration of the industry. The conference believes that this program must embrace three things—the sale of adequate wiring on a large scale, the education of the small contractor to better business standards, and a greater pressure of popular advertising by the electrical industry. It is a large order. It will require generous appropriations by the national associations and by companies. But nothing less will be effective.

## *Too Many Variables Exist in Transmission Problems*

CONTINUITY of service by high-voltage transmission lines is a problem of unceasing interest and importance. The economic rewards of first-class service are matched by its effect on public relations. Notable progress is being made in the study of the phenomena underlying transmission practice, and the pioneer work of the manufacturers' laboratories is being supplemented by increased efforts to co-ordinate field observations and deduce from these the relative value of various protective methods. The number of variable factors affecting conclusions, however, is still too great to satisfy critical engineering judgment.

An interesting discussion of flashover problems has recently been published by the overhead systems committee of the Engineering Section, New England Division, N.E.L.A., based on a series of tests made last year on the 66-kv. circuits of the Turners Falls Power & Electric Company. Analysis of motion-pictures taken at the time led some engineers to accept three conclusions: (1) Devices on the line ends of insulator strings give about 10 per cent additional protection; (2) devices on both ends of insulator strings give about 54 per cent increased protection; (3) electric control devices are required when short circuits materially exceed 240 amperes, because of damage to insulators. Other engineers differed widely in their interpretations of the test data.

Actually, such tests on lines in the field are highly useful, even if generally acceptable conclusions are as yet unattained. We see these variables face to face when we seek to interpret such data. It is very important to accumulate a large number of observations upon the behavior of insulators and power arcs following up flashovers under a wide range of conditions on operating systems. We need more light upon many things—on the effect of arcing horns, grading rings, inter-disk gaps and distribution of voltage stresses; on the number of test "shots" and field flashovers reasonably necessary to permit detailed conclusions on a single line, on a system and between systems; on the relative effect of circuit breakers and power arc breaks on surge formation; on the amount of energy justifying particular interpretations; on the influence of wind conditions, the value of shorter disk spacing, the types of connections between units of strings, and so on.

The art of transmission has reached a stage where it justifies liberal outlays of time and money for assembly and analysis of facts bearing upon local flashovers and interruptions. Free interchange of data among those competent to discuss such problems is also essential.

* * * *

## *Benefits Available if Efforts Are Expended*

POSSIBILITIES for increased sales and improvement of a system load factor through the sale of electrical energy for industrial heating are enormous. But this class of load will not knock on the door for admittance. Competition is keen. The manufacturers of natural gas and fuel oil are competitors. The industrial man must be convinced of the advantages of electricity for industrial heating. The selling can be done by the manufacturers of heating equipment and by the utilities. Each must do its share, as the most effective work can be accomplished only through co-operation.

The industrial heating committee of the N.E.L.A. has prepared considerable data on methods of surveying the utility's territory for the adaptation of electric heat to specific applications and on the results that have been accomplished. A five-reel motion picture entitled "Electric Heat in Industry" has been prepared for the use of utilities. When shown before prospective customers it is a most convincing salesman. From time to time the committee sponsors schools for the training of industrial electric heating engineers.

It remains for the utilities to take advantage of these opportunities to increase their business. No group should be more interested than they.

## *Transmitting Power Through Insulation*

AN INTERESTING case of apparent paradox in present-day electrical engineering is the series capacitor, which has recently been applied for the first time to transmission-line practice. A group of three of these capacitors has been placed in series with a 20-mile, 33-kv. line running between Amsterdam and Ballston Spa., N. Y., and the entire 7,500 kva. which passes over the line is transmitted through their dielectric.

This may seem a startling thing, since the profession has been engaged for years in the development of better solid and liquid dielectrics to withstand the increasing voltages used in transmission and the better to protect transformers and other apparatus from high potential disturbances resulting from lightning and switching operations. To be sure, any one who is familiar with radio knows that the high-frequency impulses travel through the dielectric of the condensers. But when it comes to commercial power, measured in thousands of kilowatts, it seems a pure figment of the imagination.

Operating data taken over a period of four months on the New York Power & Light Corporation's system give strong evidence that there is no paradox involved in transmitting power through insulation. The three series capacitors have been in continuous service during that period, transmitting regularly, day after day, as much as 5,000 kva. from the bus of the Amsterdam steam station into the system at Ballston and beyond to Spier Falls.

The importance of the capacitor lies in its ability to neutralize line reactance at all loads. The 20-mile line in which the group of capacitors is connected operates without reactance drop, achieving the voltage characteristics of direct-current transmission. And long-distance direct-current transmission has been the dream of engineers since the time of Edison's Pearl Street station, when one mile was the limit of distribution. Is it too much to expect that this new development may mean transmission of far greater blocks of power than at present; that greater distances may be covered than are now economically possible, and that thousands of miles of rural line may soon reach loads which are so light that their present-day development is impracticable?

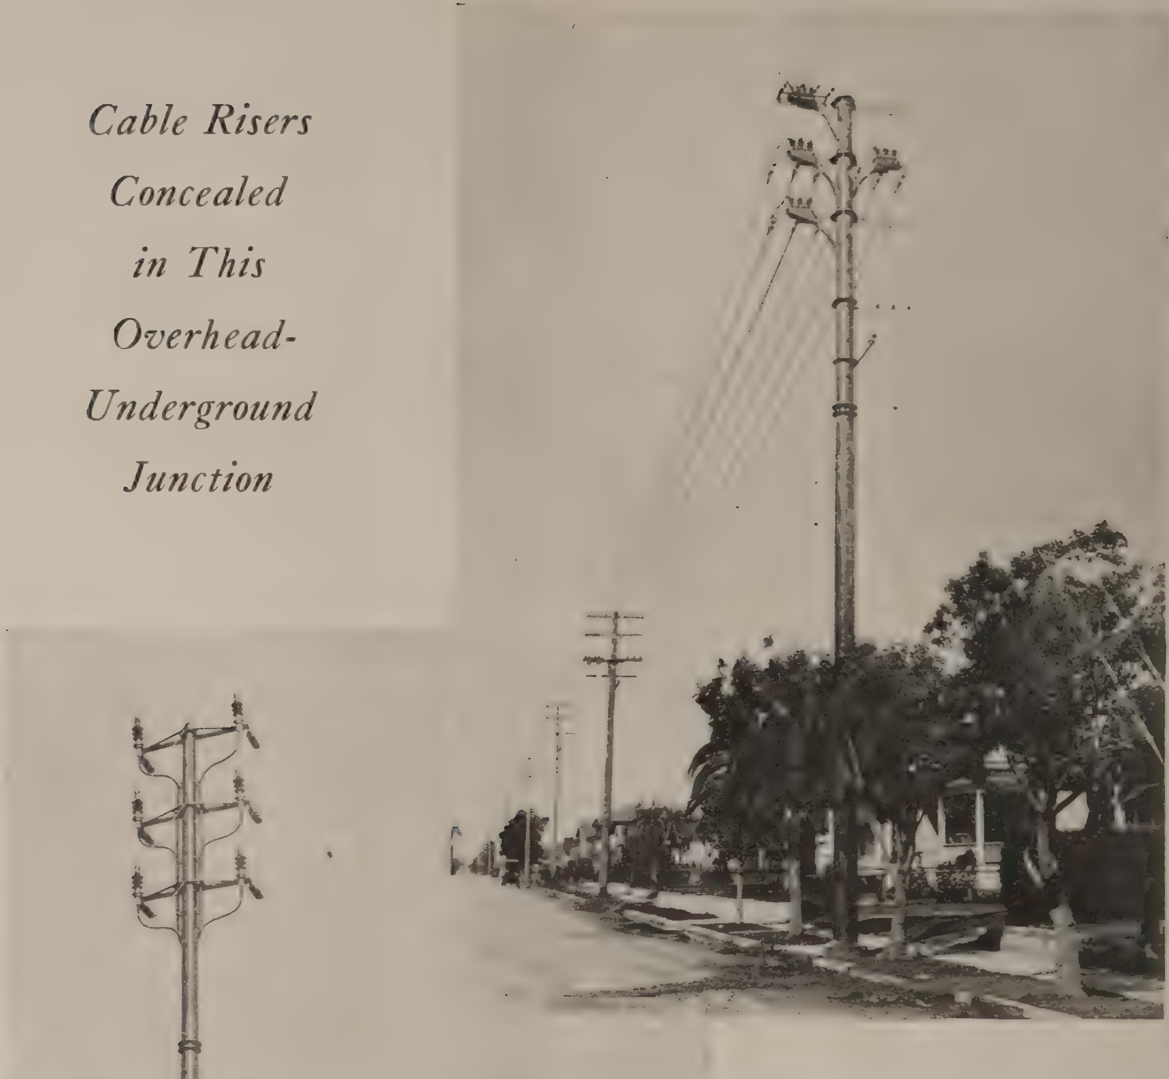
## *A New Hope Found in the Fixture Show*

A NEW spirit in the fixture industry was evidenced last week at the annual trade show of the Artistic Lighting Equipment Association, held in Chicago, in the appearance of a new modern expression of art in fixture design. It manifested itself conspicuously in one or two exhibits. It cropped out in many other places. There seemed to be a groping for a new approach to the old problem of providing a base for the incandescent lamp that will combine efficient illumination and a contribution to the interior decoration of the home. It took the form of modernistic expressions in both metal and glass and achieved not only interest but beauty.

The fixture industry has long languished for the want of new thought. Manufacturers continued to follow the old path of tradition, designing lighting equipment after the pattern of the candelabra and the chandelier, despite the fact that the candle has long since been laid aside in so far as general illumination is concerned and that we have instead a new source of light, intense and of large volume. Year after year the new fixtures for household use have brought but superficial changes in the old themes, and what wonder that the public has refused to become interested in the idea of buying new fixtures as it buys new furniture. "Modern" fixtures have established no vogue, have made no appeal to the popular fancy. And so little progress has been made with the electrical man's refixturing idea.

In this exhibition the Artistic Lighting Equipment Association has begun to demonstrate the meaning of the word "artistic" as applicable to home lighting, and its members have shown the compatibility of art and practical illumination. For the tendency in this modern expression is clearly toward the use of glass and parchment for shading and directing the light and eliminating exposed lamps. The lingering impression, however, is the hope that the fixture designer is really at last pushing forth into the open water of creative art. No one can doubt that the industry would profit greatly from such an excursion. For if vogue in fixtures can be established so that modern fixtures look new and have a mode appeal, the public will buy them and discard the obsolete just as it modernizes its other choice possessions.

# *Cable Risers Concealed in This Overhead-Underground Junction*



CONFRONTED with the problem of joining underground cables with overhead circuits in a residential section of Los Angeles, the Bureau of Power and Light was particularly anxious to avoid aggravating the public's objection to overhead lines, which would result from a nest of exposed cable risers. By using tubular poles in which the cables are concealed except where they emerge at the top it was successful in removing the objections to underground-overhead junctions at least. Some of the features of construction are presented on page 1383.

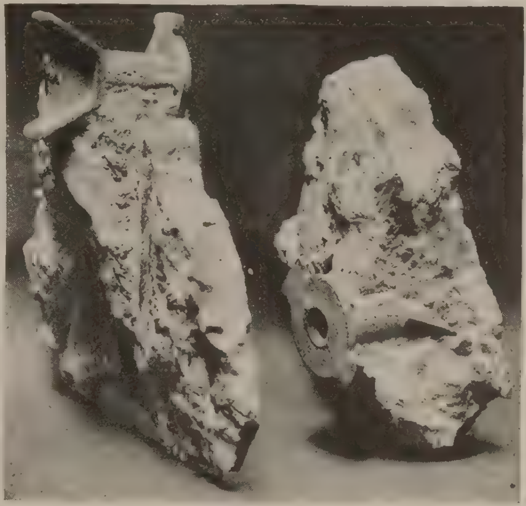
# Concrete Bus-Structure Tests

Characteristic failures of monolithic, thin-wall bus structures and supporting equipment developed in laboratory tests. Tension and compression strength values established

By Willard A. Kates

*Engineer Day & Zimmermann Engineering & Construction Company*

THE concrete cell-type bus structures which are widely used in substations and medium-capacity power plants are formed of relatively thin walls and horizontal slabs cast monolithic. Because of the thin cross-sections involved, predetermination of the mechanical strength is difficult. A "sloppy," well-puddled concrete mix is essential to assure filling the thin sections, particularly around the reinforcing steel. Even with the most thorough puddling a uniform distribution of concrete aggregates is questionable. Calculations of reinforced concrete slabs are based on definite positions for the reinforcing bars. In thin slabs a small absolute variation from the assumed position results in a large percentage change in strength. In addition, the mechanical loading due to short-circuit forces is impressed on the horizontal slabs over the restricted areas of bus support bases and the vertical compartment walls opposite these bus supports are weakened by the openings provided to permit installation and maintenance of the latter.

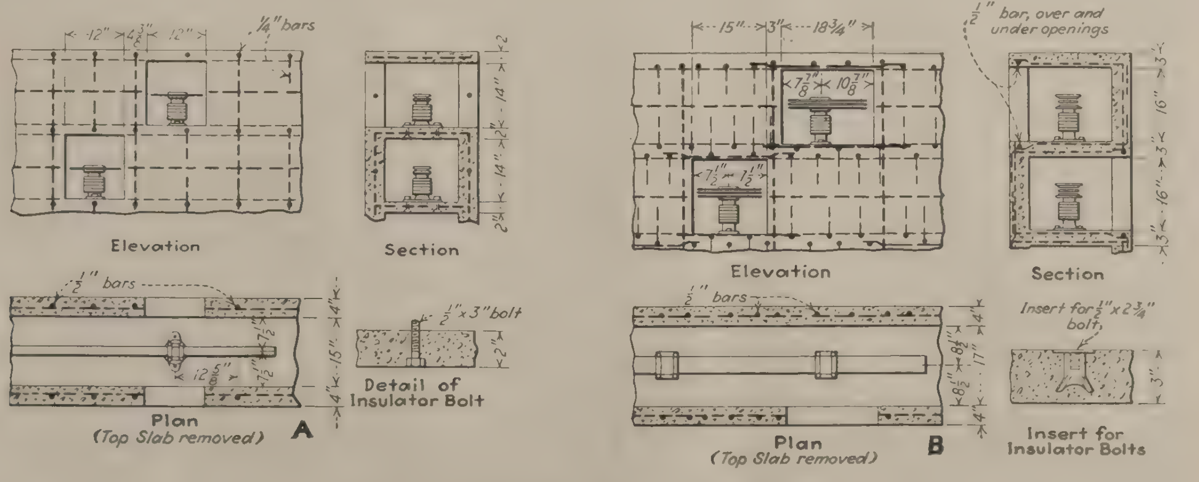


*Characteristic failures of bus structures*

Conical failures for tension (left) and compression (right) are typical of these tests.

To determine the composite results of these factors and compare two designs of cell structures typical sections were constructed and subjected to mechanical loading tests. Six sections of each type of structure were cast of 1 : 1½ : 3 concrete under conditions duplicating those obtained on a construction job. The reinforcing steel was placed and the concrete poured by field construction men, as a part of a construction job. It may be noted from the illustrations that the two types of structures differed in a number of respects.

It was anticipated that tests of these typical sections



*Sections of two types of bus structures tested*

The type A sections were constructed with 2-in. horizontal slabs, whereas the type B structures were constructed with 3-in. slabs. The differences in reinforcing steel sizes and locations are shown. The bus supports of the type A structures were held by bolts extending through the horizontal slabs with heads flush with the underside of the slab. In the type B sections the bus supports were held by means of bolts screwed into concrete inserts set in the slab. The 3-in. type B slabs permitted the use of these inserts without providing a complete metallic path through the slabs. The type A compartments were equipped with bus supports having cast iron bases, while the type B compartments had malleable iron bases. The bus supports of the type A structure were set on 4-ft. 10-in. centers, whereas those in the type B structure were on 2-ft. 9⅜-in. centers (max.)

*(a) Type A section in tension tests. (b) Type B section under compression stress*

would indicate the performance of entire structures, since the latter would consist of a succession of the test sections cast monolithic and since each section would support an identical arrangement of bus supports. It was also thought that the strength of the bottom slab of the top compartment would be typical of the two slabs below, since this slab is supported by vertical walls in the same manner as are the two lower slabs.

The application of impact to the bus support was considered as a method of test, but was abandoned in favor of slowly applied loading. While the force applied during short circuits is of the nature of an impact, the duplication of such impact was beyond the possibility of the investigation. Furthermore, progressive impact application to destruction would have produced a fatigue type of failure which would not be as informative for design purposes as failure due to slowly applied loading.

As indicated in the illustrations, the sections were supported on wooden blocks on the head of a 50,000-lb. Olsen machine. A transverse steel bar was clamped on the bus support in place of the busbars and was yoked by two steel rods to a similar bar on the movable testing head. The position of the test specimen, whether erect or inverted, was determined by the type of test desired, i.e., whether compression or tension.

The results of tension tests are summarized in Table I.

*Table I—Tension Loading Tests of Concrete Bus Compartments*

| Test Section Number | Type | Age, Days | Breaking Load, Pounds | Approximate Size of Spalled Area, Inches | Radius in Inches from Bolt or Insert Center to Edge of Spalled Area Max. | Min. | Remarks |
|---|---|---|---|---|---|---|---|
| 1 | A | 54 | 5,950 | 12 x 17 | 7 | 3 | Breaking load preceded by load of 5,130 lb., which broke bus support base. Base replaced with steel plate and failure loading applied. |
| 3 | A | 54 | 6,560 | 14 x 16 | 7 | 3 | Breaking load preceded by load of 5,660 lb., which broke bus support base. Base replaced with steel plate and failure loading applied. |
| 7 | A | 57 | 5,550 | 13 x 15 | 8 | 5 | ........ |
| 8 | A | 56 | 5,230 | 11 x 15 | 7 | 4 | ........ |
| Average | .. | .. | 5,823 | ......... | ... | .. | ........ |
| 6 | B | 49 | 12,245 | 18 x 21 | 13 | 5 | Breaking load preceded by loads of 4,570 lb., and 5,060 lb. which broke bus support porcelain. Bus support replaced by yoke and failure loading applied. |
| 4 | B | 49 | 12,535 | 18½ x 13 | 8 | 3 | Breaking load preceded by load of 8,715 lb., which deformed cross bar applying load. Bar replaced and failure loading applied. |
| 10 | B | 48 | 11,700 | 17 x 19 | 9½ | 4½ | Compartment had spalled area on under side of horizontal slab and under bus support location. Apparently did not affect strength of specimen. |
| 11 | B | 48 | 10,670 | 15½ x 16 | 8½ | 6 | ........ |
| Average | .. | .. | 11,788 | ......... | ... | .. | ........ |

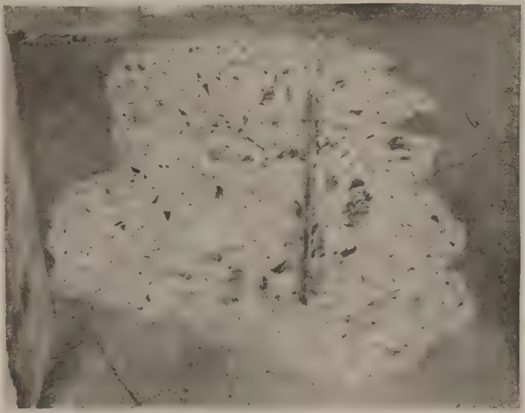
*Table II—Compression Loading Tests of Concrete Bus Compartments*

| Test Section Number | Type | Age, Days | Breaking Load, Pounds | Approximate Size of Spalled Area, Inches | Radius in Inches from Bolt or Insert Center to Edge of Spalled Area Max. | Min. | Remarks |
|---|---|---|---|---|---|---|---|
| 2 | A | 55 | 14,015 | 13 x 17 | 10 | 3 | Breaking load was preceded by loads of 10,095 lb. and 11,095 lb., which resulted in bus support failures. Bus supports replaced by steel plate of same contour as bus support base and failure loading applied. Slight cracking radially. |
| 9 | A | 56 | 11,610 | 15 x 18½ | 10 | 8½ | Radial cracking in slab and side walls. |
| Average | .. | .. | 12,813 | ......... | ... | .. | ........ |
| 5 | B | 50 | 23,550 | 16½ x 19 | 10 | 6 | Breaking load was preceded by a load of 21,415 lb., which resulted in deformation of cross bar applying load. Bar replaced and failure loading applied. |
| 12 | B | 51 | 19,420 | 17 x 21 | 12 | 9 | ........ |
| Average | .. | .. | 21,485 | ......... | ... | .. | ........ |

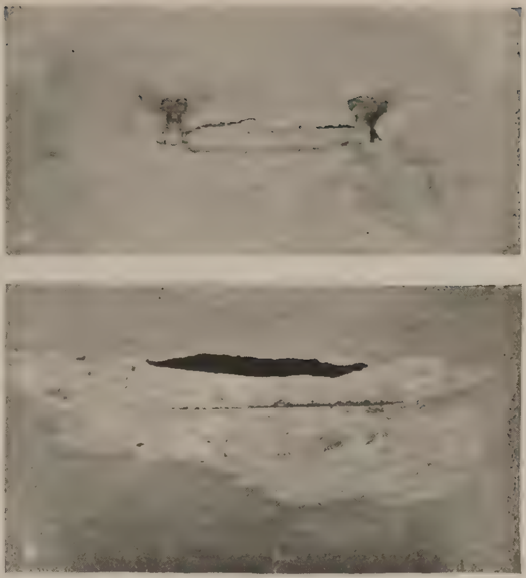
The tests of type A sections were featured by the failure of the cast-iron bases of the bus supports. It was not possible to develop the strength of the bolts as set in the slab by pulling the bus support and a heavy steel plate was therefore substituted to permit failure loading of the concrete. Typical shear and spalling and the pulling out of the bolts are shown in the accompanying illustration.

The bus supports of the type B specimens were also insufficient to pull out the inserts, but their failure occurred in the porcelain. They were replaced with a steel plate for continuance of tests. Failures of the concrete section then occurred by fracture over a conical surface.

Compression test results are summarized in Table II. Here also the cast-iron bases of the type A bus supports proved inadequate to distribute the load properly from porcelain to concrete. The deformation of the latter resulted in the breaking of two cast bases, and further tests were made by applying the load to the concrete on a steel plate having the same shape and area as the casting. Under such compression loading the type A specimens developed a failure accompanied by radial cracks in the horizontal slab. One test section developed cracking of the side walls, being the only specimen to do so in either tension or compression tests.



*Typical tension failure*
Note cavities in bolt positions

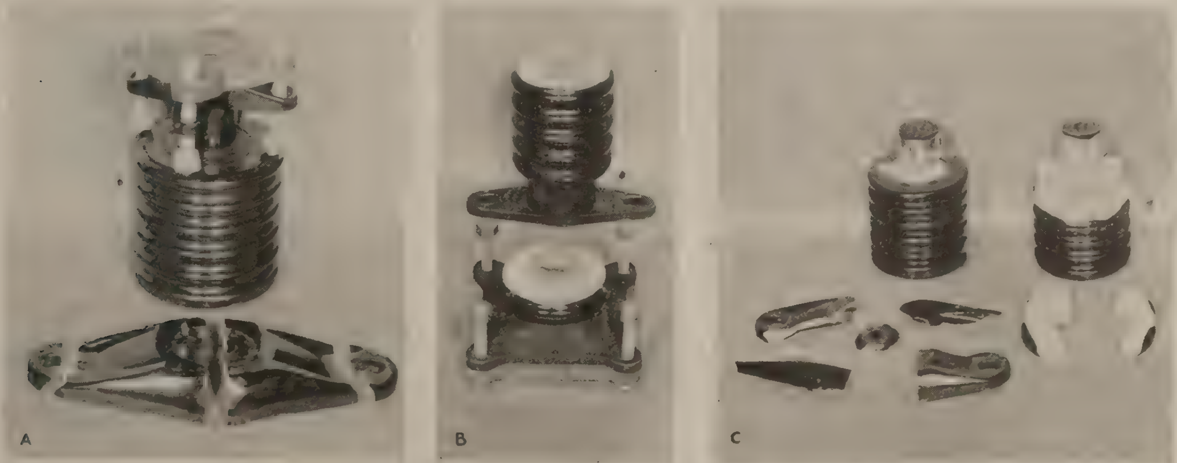


*Typical compression failure*
Conical failure is characteristic—(a) shows failure from above, (b) from below.

The type B bus supports withstood compression loading to failure of the type B test specimens, the only distress shown being a deformation of the base to conform to the contour of the bending of the concrete slab. Such deformation is of benefit rather than harm, for it results in the applied load being distributed over the area of the base. Failure of the concrete occurred by fracture over a truncated conical surface tapering out from the edge of the bus support base.

Comparison and review of these tests show the following prominent features:

1. All concrete was of good quality and there was much shear through the coarser aggregate. There was no relation apparent between the area of the spalled section and the ultimate strength of the test section. The amount of spalling was probably limited in many cases by the reinforcing steel and the vertical walls of the specimen.



*Iron bus support failures*
(a) Base casting failure in tension type A support. (b) Insulator failed in tension type B support. (c) Compression destruction of type A support.

2. The type B structure, having 3-in. horizontal slabs and using bolt inserts, is approximately twice as strong as the type A structure, which is of 2-in. horizontal slab section, using bolts set in concrete.

3. The type A design was of better balance than the type B. Any interphase short circuit causes tension on the supports of one phase. The limit of any design is therefore the tensile strength of either the bus support or its attachment to the concrete. The failure load of the type A bus support in tension is of the same order of magnitude as the failure load of its attachment to the concrete.

A much heavier bus support of more than twice the strength of the type B could be used in the type B bus structure with resultant better balance of design for the structure as a unit.

4. Failure in either type of structure due to mechanical loading of the bus supports would probably not result in failure of the side walls of the structure. Spalling and cracking of the concrete were, in all instances save one, confined to the horizontal slabs.

5. As a corollary, the cast-iron bus support bases were much inferior to the design of malleable iron, both in tension and compression loading. This fact was further checked by placing a support with cast-iron base on the smooth bed of the testing machine and loading it in compression.

In three such trials the bases broke at 17,250, 14,900 and 14,400 lb. Similar test of a type B support with malleable base produced no distress under loading of 50,000 lb.

## Modern Elevators

PRESENT tendencies in elevator design are directed toward higher intensity of service, higher quality of service, improved safety or better economy, although most improvements involve several of the desired qualities.

*Higher intensity of service* has been secured by:

New control systems using multi-voltage operation.

Joint operation of two elevators in up and down service.

Car position indicator exposing floor numbers successively.

*Higher quality of service* has been secured by:

Gearless instead of geared machines.

Automatic scheduling device to signal operators starting from terminals.

Automatic spacing device to minimize stops per car.

*Improved safety* has been secured by:

Tied-down compensator frames, which eliminate slack formation in cables under emergency stopping conditions.

Institution of slow-speed, zone, automatically controlled at terminal landings.

Improved safety gates, eliminating shearing hazards.

*Better economy in manufacture* has been secured by:

Main-motor-micro for speed control during self-leveling period, eliminating large quantities of auxiliary apparatus.

Micro-selector in machine room, eliminating leveling switch on car and cams at each floor.

Improved door hangers, minimizing friction and clearances.

# Computing Compensator Settings for Automatic Voltage Regulators

FOURTH ARTICLE

By V. W. Palen

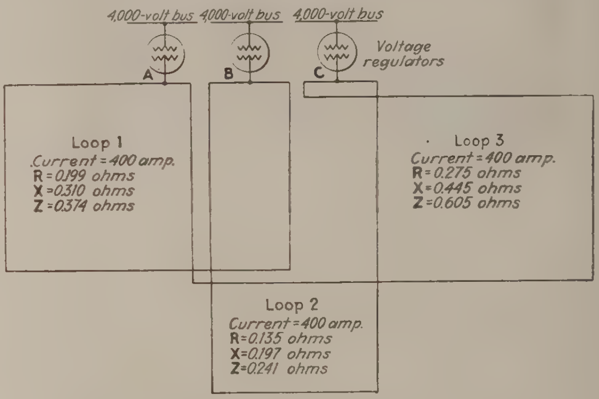
TRIPLE LOOP CIRCUITS.—The procedure outlined in previous articles for single-feed, single-loop and double-loop circuits has been tested in everyday practice and found satisfactory. For a triple loop a similar procedure may be followed. As with the other loop circuits the calculations would net a set of values thus:

*Loop 1*
Resistance drop = 3.98 volts
Reactance drop = 6.2 volts
Impedance drop = 7.48 volts

*Loop 2*
Resistance drop = 2.70 volts
Reactance drop = 3.94 volts
Impedance drop = 4.82 volts

*Loop 3*
Resistance drop = 5.50 volts
Reactance drop = 8.90 volts
Impedance drop = 12.10 volts

An examination of the accompanying illustration will disclose that *A* compensator and regulator regulate the voltage on half of loops 1 and 3. Therefore, the settings on the compensator on *A* regulator will be set for the average voltage drops for loops 1 and 3 thus:



*Triple circuit assumed for illustrative calculations*

$IR$ = (average of 3.98 and 5.50) = 4.74 volts
$IX$ = (average of 6.2 and 8.90) = 7.55 volts
$IZ$ = (average of 7.48 and 12.10) = 9.79 volts

Also, *B* regulators regulate half of loops 1 and 2. Therefore, the settings on the compensators on *B* regulators will be set for the average voltage drops for loops 1 and 2 thus:

$IR$ = (average of 3.98 and 2.70) = 3.34 volts
$IX$ = (average of 6.2 and 3.94) = 5.07 volts
$IZ$ = (average of 7.48 and 4.82) = 6.15 volts

Finally, *C* regulators regulate half of loops 2 and 3. Therefore, the settings on the compensators on *C* regulators will be set for the average voltage drops for loops 2 and 3 thus:

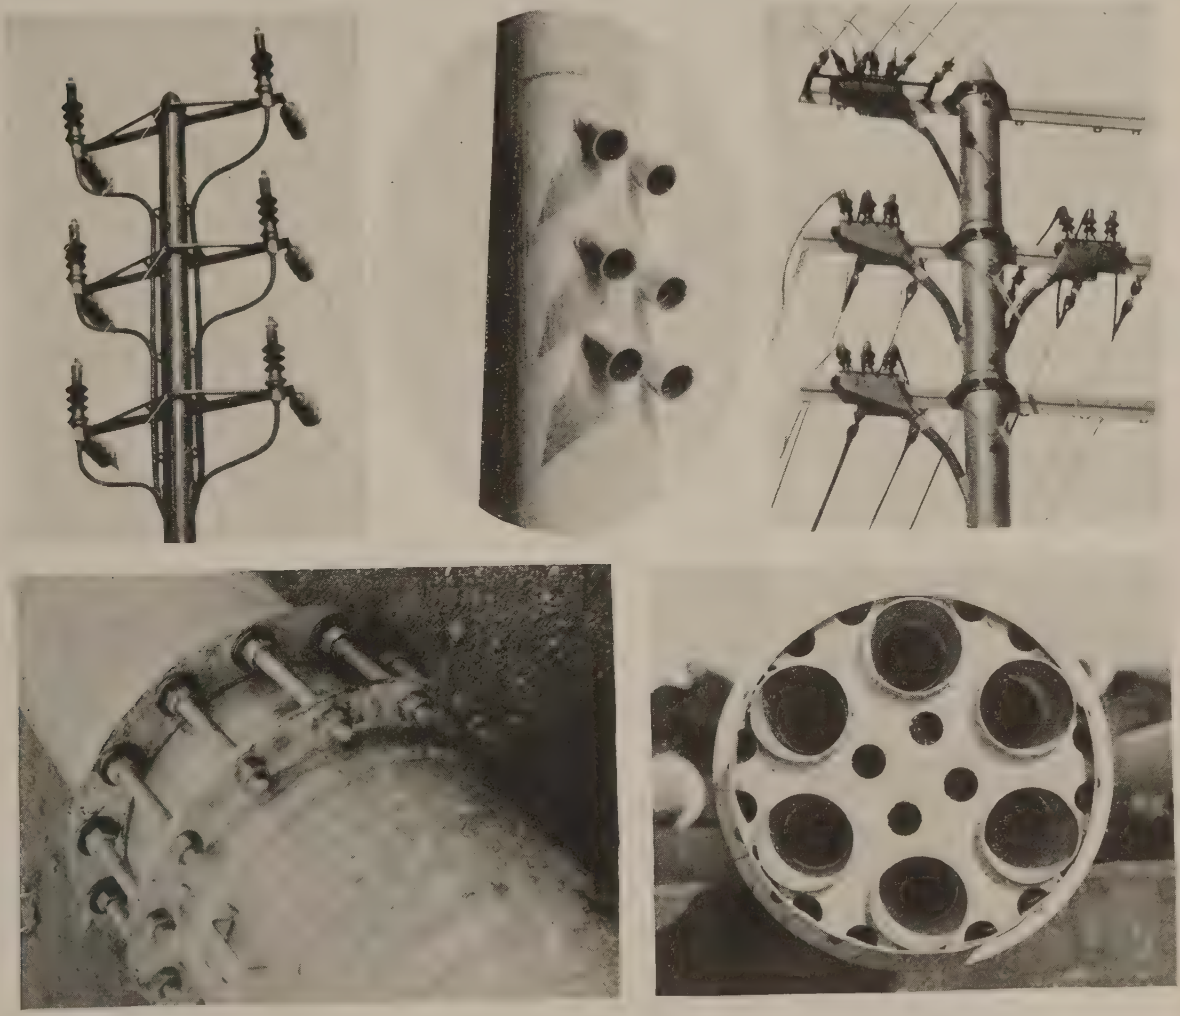
$IR$ = (average of 2.70 and 5.50) = 4.10 volts
$IX$ = (average of 3.94 and 8.90) = 6.42 volts
$IZ$ = (average of 4.82 and 12.10) = 8.46 volts

The various types of compensators and setting methods will be covered in the next and final article of this series.

# Tubular-Steel Poles for Cable Risers

By C. H. Jenkins
*Underground Engineer*
*Bureau of Power and Light, Los Angeles, Calif.*

Wood poles for cable terminal risers to overhead lines have been the source of considerable trouble and expense, due to the pole igniting when a ground occurs on a circuit at this point. Latticed steel poles with cable pipes placed inside the structure frequently have been used. They provide ample strength and are free from fire hazard, but can easily be climbed by unauthorized persons. Furthermore, the exposed conduits are rather unsightly in appearance.



*Details of tubular pole construction for overhead-underground junctions*

The pothead-to-line-conductor construction for two 33,000-volt circuits and for four feeders from a single pole is illustrated in the upper views, as are the details of the pole base through which cables are conveyed to conduit lines. The method of joining pole sections is also illustrated, as is the arrangement of cable conduits within the pole with steel diaphragm support.

Rapid increase in the number and size of distribution circuits has made it necessary to substitute some pole material which will not burn, yet will provide suitable strength and present a satisfactory appearance on the street. Believing that a tubular steel pole with cable pipes installed within the pole would best meet the requirements for strength, durability and appearance, the Bureau of Power and Light of the city of Los Angeles has purchased several taper-tube poles made by the Taper Tube Pole Company of San Francisco and erected them at cable terminals adjacent to a new class "A" distribution substation.

This station will have an ultimate capacity of 31 primary feeders, twenty street-lighting circuits and twelve 33-kv. incoming and "peddler" lines. Three-conductor, 500,000-circ.mil, 5-kv. cable is used for primary feeders, four-conductor, No. 6, 5-kv. cable for street lighting circuits, three-conductor, 400,000-circ.mil, 33-kv. cable for conduit runs and 500,000-circ.mil, single-conductor cable for cable-pole risers for the high-tension lines. The three single-conductor, 33-kv. cables are placed in one 6-in. conduit riser to reduce sheath current and voltage.

The tubular steel poles are made of No. 10 gage sheet-steel rolled into taper tubular form and butt-welded. A No. 10 gage sheet-steel diaphragm is welded to the tube near each end of all sections to hold the cable pipes rigidly in position and stiffen the pole against crushing strains. At one end of each section the cable pipes are provided with loose couplings for alignment. The poles are made in sections which are swedged together in socket formation and held rigidly by ¾-in. bolts between the flanges. The method of taking out the six 3½-in. cable pipes with 4-ft. radius bend for connecting to the conduit line at the pole base is shown.

An angle bar bent in "U" form is welded to the pole for crossarm support. Three classes of crossarm are provided, as follows: No. 1, designed for dead-ending six conductors, each with 1,800-lb. pull and of sufficient strength to resist twisting or buckling with two wires broken on each side of the pole. The arms are placed on 4-ft. centers and support flat-type potheads with cable outlet at an angle of 45 deg. A pole with three such crossarms and four circuits in place is shown. No. 2 crossarm is designed for supporting eight conductors in both buck and line arm positions. No. 3 arm is for dead-ending two 33-kv. conductors each with 1,500-lb. pull and is of sufficient strength to resist twisting or buckling with one wire broken. One pothead terminating one single-conductor, 33-kv. cable is attached to each end of each arm by means of a bracket. These arms are placed on 6-ft. centers.

| Pole No. | No. of Sections | Outside Butt Dia., In. | Outside Top Dia., In. | Length | Cable Pipes Inside Dia., In. | Cable Pipes No. | Crossarms No. 1 | Crossarms No. 2 | Crossarms No. 3 |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 4 | 19¾ | 12 | 82 ft. 3 in. | 3½ | 6 | 3 | 6 | 3 |
| 2 | 3 | 17½ | 12 | 61 ft. 3 in. | 3½ | 6 | 3 | 2 | .. |
| 3 | 3 | 18½ | 12 | 70 ft. 3 in. | 3½ | 6 | 3 | 1 | 3 |
| 4 | 3 | 18¾ | 12 | 72 ft. 3 in. | 6 | 2 | .. | 1 | 3 |
| 5 | 4 | 20 | 12 | 84 ft. 3 in. | 6 | 2 | .. | 6 | 3 |
| 6 | 2 | 16¾ | 12 | 54 ft. 3 in. | 3½ | 6 | 3 | .. | .. |

All poles are set 8 ft. deep in a concrete base 1 ft. greater in diameter than the pole and 6 in. deeper. The poles are assembled in the yard, hauled by truck to location and erected with a gin pole of the ordinary type. A short gin pole is temporarily attached to the pole top to assist in drawing riser cables from the nearest manhole through the cable pipes to pothead position. The poles are head-guyed in the usual manner.

Double hot process galvanizing is applied to all poles at the factory and after erection they are painted with one coat of red lead and one coat of green pole paint to harmonize with tree foliage. A spun copper acorn is attached to the pole top to exclude moisture and provide ornamentation.

Specifications for several types of poles are given in the accompanying table.

## Restoring Service from Flooded Generators

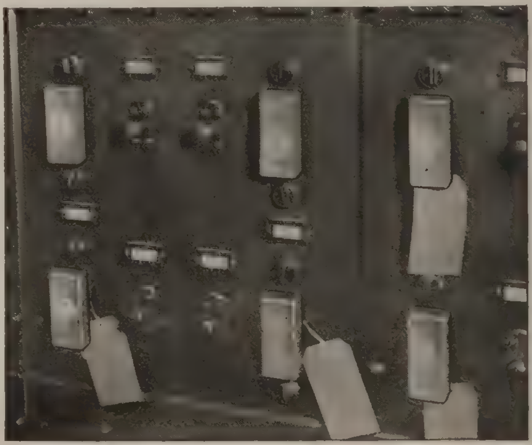
By William Wallet
*Electrical Department, Vermont Marble Company, Proctor, Vt.*

The Proctor hydro-electric station of this company presented the chief problem in service restoration when flooded last fall. The plant contains one 1,600-kw. and three 750-kw. vertical units generating at 280 volts and operating under a head of 120 ft. Following the subsidence of the flood it was found that the generating units and switchboard were almost covered with waste marble, sand and gravel. Twenty-five men worked more than three days to clear the first floor, after which a space in the cellar was cleared sufficiently to permit the installation of a large hot-air furnace built with three pipe outlets and a motor-driven fan to speed up air circulation.

Each generating unit was taken apart and the parts cleaned from sand and grit, after which it was reassembled and a temporary housing built over it to hold the heat, hot air then being circulated from the furnace piping through the under side of the machine and thence through the windings. The machine was then started, but not built up to generate. After running it 24 hours it was shut down, the temporary wooden housing set to one side and the machine blown out with compressed air at about 80 lb. pressure. The temporary house was again placed over the machine and the generator leads short-circuited at the switchboard, starting the machine and circulating full-load current. This, with the heat from the furnace, built up a temperature on the windings of about 200 deg. F., which was held for three days. A "megger" test showed 35 megohms between windings and frame, and after removing the short circuit the units were put on the line. The first machine went on the line twelve days after the flood hit the plant.

## Signal Device Promotes Safety on Circuits

An insulated detachable cover to prevent premature operation of control switches has recently been installed at the generating plant of the Salem (Mass.) Electric Lighting Company. It consists of a bakelite box with rubber extensions and slotted design which enables the device to be slipped over the switch control button, as illustrated, and hung in place as desired. Covers used to protect lines whose disconnecting switches are open or whose conductors have been grounded are painted red and those used to remind the operator that a particular switch is to be opened only after removal of the cover are painted gray. Suitable printed and symbolic designations are carried on the covers as desired. These signal devices have been patented by Allen J. Ryno, chief operator of the Salem company, and are manufactured by the States Company, Hartford, Conn.



*Device hung over control switch buttons warns against operation*

# *Effect of* Sudden Loss of Load

Voltage and frequency conditions following the sudden dropping of load on 20,000-kva. hydraulic-driven generator. Voltage may reach values detrimental to machine insulation

By C. B. HAWKINS*, S. MURRAY JONES† and O. E. CHARLTON†

TO DETERMINE the increase in voltage and speed when full load is suddenly dropped from a generator and to obtain data on the operation of an overvoltage overfrequency relay, tests were recently made by the Alabama Power Company at its Mitchell Dam plant, on the Coosa River. The overvoltage overfrequency relay used was designed to open the main field circuit and the low-tension breaker when the speed and voltage had increased to some predetermined value.

In all the tests, shown in Figs. 2 to 18 and Table I, the generator was made to carry full load at some predetermined power factor and then the load was dropped by opening either the high-tension or the low-tension breaker, depending upon the particular test being made. A six-element oscillograph recorded the increase in voltage and speed resulting from the sudden decrease in load, as well as other information pertinent to the object in view. A number of tests were made before the overvoltage overfrequency relay was put in service, giving some idea of the maximum voltage to be expected under the worst conditions (Figs. 2 to 12). The relay was then connected and the tests repeated (Figs. 13 to 18). By comparing the results of the two series of tests the effects of the relay were clearly shown.

After analyzing the results of these tests the following conclusions were formed:

1. When a generator suddenly drops its load, there is an accompanying rise in voltage, which at times may attain values sufficiently high to affect the insulation of the connected apparatus.
2. The present voltage regulator reduces the overvoltage somewhat, but is not able to prevent the voltage from rising to excessive values.
3. The power factor of the load has little effect on the total increase in voltage, but it does affect the rate of increase. When the load of low power factor is dropped from the generator, the rise in voltage will be more rapid than an equal load of higher power factor.
4. When power transformers are connected to the generator, the magnetizing current constitutes a load on the machine and tends to hold the voltage down, though this effect is not very pronounced.
5. The overvoltage overfrequency relay used did not function sufficiently fast to prevent the voltage from rising to values that might prove destructive to insulation. It was found that certain refinements in setting the relay were possible, but were unknown at the time of these tests. These refinements would probably have made the relay more definite in operation. Further tests are to be made some time in the future to clear up these points.

To obtain a complete record of the principal factors contributing to the above conclusions, tests were made under the following conditions: (*a*) Voltage regulator in service, (*b*) voltage regulator out of service, (*c*) load dropped by tripping the low-tension breaker, (*d*) load dropped by tripping the high-tension breaker and (*e*) power factor of load changed. After analyzing the results obtained from these tests, an overvoltage overfrequency relay was connected to the generator and the tests were repeated. The relay used was not a standard product, but an experimental piece of apparatus consisting of a combination of a frequency relay and an overvoltage relay. The contacts of these relays were in series, so both had to be closed before the auxiliary relay could open the generator field circuit. In the test shown in Fig. 17 the relay was operated by the overfrequency element only, whereas that shown in Fig. 18 was operated by the overvoltage element only. The relays were set to operate on 25 per cent overvoltage and 8 per cent overspeed.

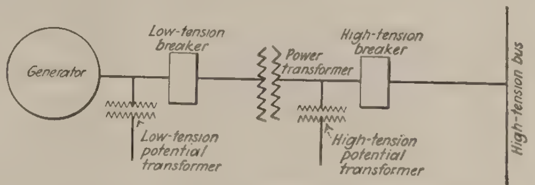


*Fig. 1—Schematic arrangement of equipment for overvoltage overfrequency tests*

The generator used in these tests is rated at 6,600 volts, 17,500 kw., at 87.5 per cent power factor (20,000 kva.) and 100 r.p.m., and was made by the General Electric Company with direct-connected exciter. This generator is driven by a 24,000-hp. Allis-Chalmers turbine designed for 100 r.p.m. at a head of 70 ft. and is controlled by an Allis-Chalmers governor operated at 180 lb. oil pressure. A standard Tirrill voltage regulator was used. The schematic diagram of test connections is shown in Fig. 1. The test results are described in detail as follows:

*Effect of the Magnetizing Current of Power Trans-*

| Maximum low-tension voltage | 12,200 | 12,000 |

tion of the lagging current flowing through the generator armature tends to decrease the generator field flux somewhat and consequently to prevent the terminal voltage from rising as high as when the machine is operating at a higher lagging or a leading power factor.

The voltage rise expressed in per cent of the initial voltage, with and without the power transformers connected to the generator, is shown respectively in Figs. 2 and 3. The maximum voltage increase in each test is given in Table II. The increase in voltage as expressed in per cent of the initial value is greater when the power transformers are not connected to the generator. The reason the maximum voltages are about the same is that in the test shown in Fig. 2 the initial voltage was higher than that of the Fig. 3 test.

*Effect of Voltage Regulator.*—By comparing the curves shown in Figs. 2 and 4 and also Figs. 3 and 8 it becomes apparent that the voltage regulator does reduce the overvoltage to some extent, the per cent voltage rise with the regulator in service being less than when it is disconnected, but the curves show that the regulator alone is incapable of holding the voltage down to reasonable limits. In Fig. 3, which shows a condition in which the regulator was out of service and the current and voltage of the generator field increased approximately 150 per cent over the initial values, it would seem that the low-tension alternating-current voltage should have increased in proportion. The reason it did not is, of course, due to the generator field becoming saturated. The maximum values reached are shown in Table III. In each case, whether the high-tension or the low-tension breaker was tripped, the voltage increase in per cent of initial value was greater when the regulator was not in service. As before, the initial voltages were somewhat different, so the maximum voltages reached cannot be compared on an equal basis.

*Effect of Load Power Factor on Voltage Increase.*—Loads with low lagging power factor require stronger field excitation on the generator than high power factor loads. If the circuit is opened when the generator is carrying load at low lagging power factor, the rate of increase of the voltage will be greater than if an equal load of higher power factor were dropped. The effect of different power factors can be seen by comparing the curves for the tests shown in Figs. 4, 5 and 6, where the high-tension breaker was tripped, or in Figs. 8, 9 and 10, where the low-tension breaker interrupted the load. These data are compared in Table IV, which clearly indicates that the maximum value of the voltage increase is not affected very much by the power factor, but that the rate at which the voltage rises becomes greater as the power factor decreases.

*Effect of a Transmission Line Connected to Generator.*—The test shown in Fig. 11 was made by dropping the load from the generator under test at the Bessemer substation, leaving about 50 miles of transmission line connected to the machine. The curves show a very rapid increase in voltage and also a large maximum value. The voltage was prevented from reaching higher values because of the lightning arresters at Mitchell Dam discharging to ground. It should be noted that in this test the maximum speed was only 25 per cent above normal and this would tend to hold the voltage down, as the voltage varies approximately as the square of the speed. The high voltage reached in this test is partly produced by the charging current of the line, which is about 90 deg. ahead of the voltage, flowing through the reactance of the power transformers. This leading current at a low power factor gives a voltage rise through the transformer instead of the customary voltage drop which results from a lagging current.

*Separate Excitation.*—One test was made with the generator separately excited and without voltage regulation in service, the results being given in Fig. 12. It is obvious that under this condition the voltage increase is negligible, attaining a maximum of 138 per cent of the initial value. It is interesting to note in this connection that the voltage is approximately proportional to the speed of the generator, whereas with the direct-connected exciter the rise in voltage becomes approximately proportional to the square of the speed.

*Transients in the Generator Field Current.*—In all of the tests described above the generator field current was included on the oscillogram and from these records the

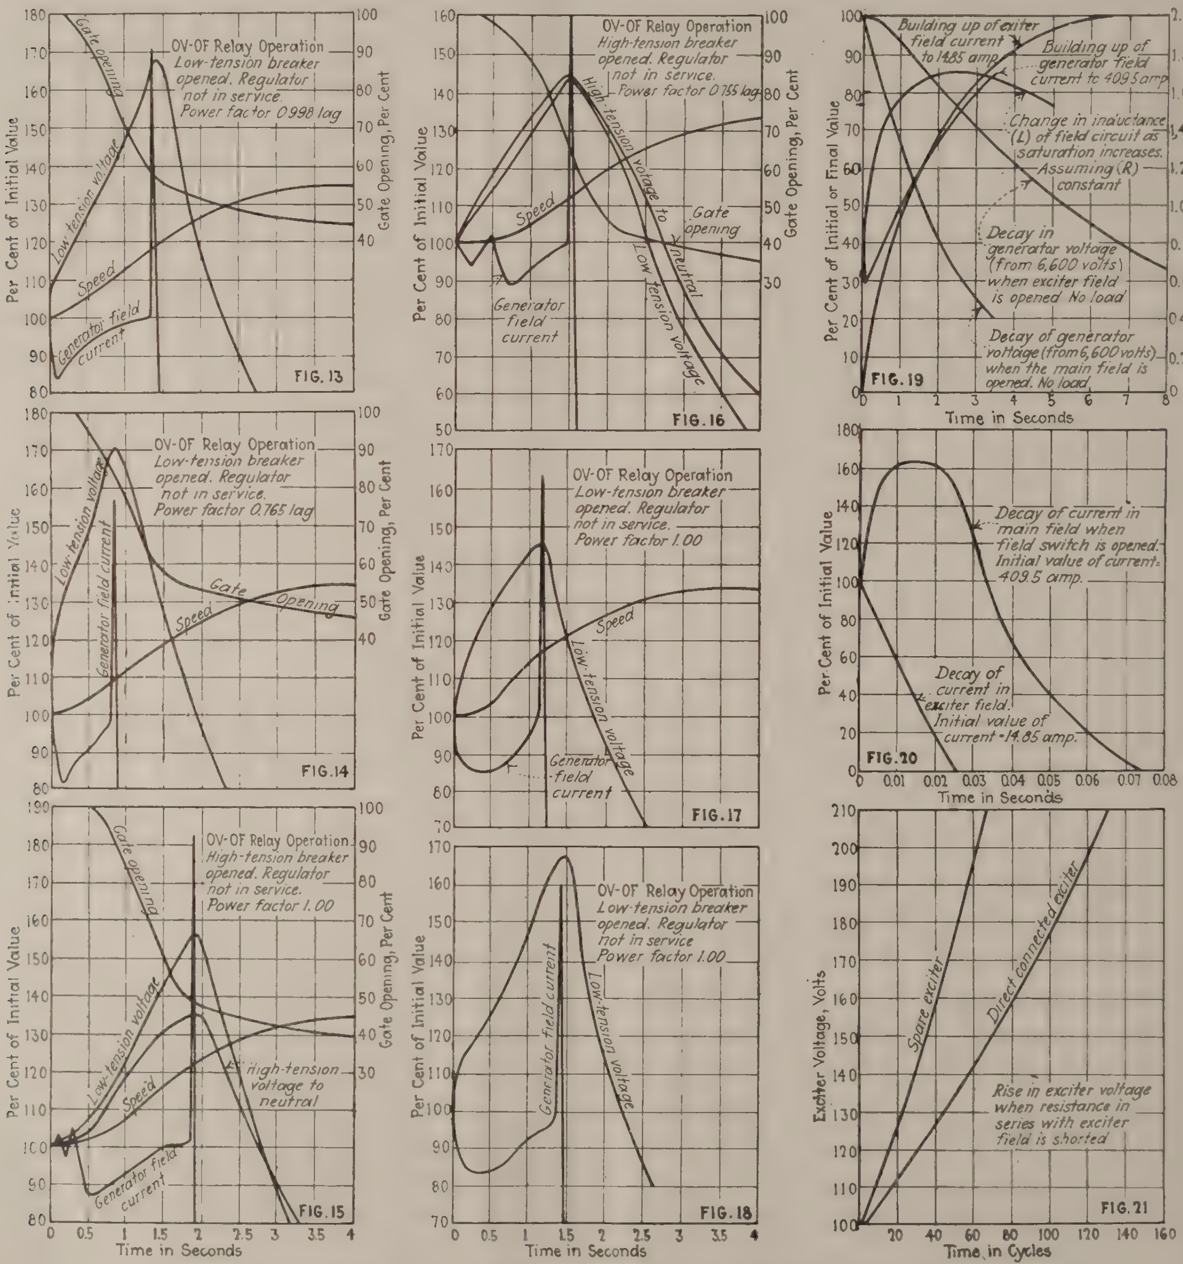
*Lag

curves of the field current against time were plotted, these being included on Figs. 2 to 12 inclusive. A transient in the generator field must of necessity follow a sudden decrease in the generator load. The reason is as follows: In the steady state condition there is a certain air gap flux in the machine corresponding to a given load and a necessary amount of ampere turns or magnetomotive force in the field to force the flux through the magnetic path and to overcome the armature reaction due to the load current in the armature. The current in the armature suddenly decreases to zero when the load is dropped and consequently the armature reaction disappears. If we assume that the flux in the air gap cannot change suddenly (and such an assumption is not greatly in error), it becomes evident that the field magnetomotive force must decrease by an amount equal to the armature reaction expressed in ampere-turns. The only way for this to take place is for the current in the generator field to decrease. After a short interval of time the air gap flux begins to change and a new state of equilibrium is established.

*Operation of the Governor in Closing the Turbine Gates.*—In order to determine the rapidity with which the governor closed the gates a resistance unit with a sliding contact was connected mechanically to the piston rod that operates the gates. By impressing a voltage on this resistance it was possible to record on the oscillograph film the position of the piston at any time after



*Figs. 13 to 21—Tests on generator under various conditions with overvoltage. overfrequency relay in service* the load had been dropped. Curves of the gate opening plotted against time will be found in Figs. 2 to 16 inclusive. From these curves it is easy to explain why in some of the tests the speed of the generator reached a maximum and then remained constant, whereas in other tests (Figs. 10, 11 and 12) the speed reached a maximum, then began to decrease. In these three tests the gates were closed more rapidly than in the other, consequently the overspeed of the turbine diminished. In Fig. 11 a condition is shown in which the governor was operated partly by hand, which accounts for its rapid closing. The tests showed that the oil pressure in the governor has a marked effect on the speed of operation.

TABLE V—OPERATION OF OVERVOLTAGE OVERFREQUENCY RELAY

|  | Low-Tension Breaker Tripped |  | High-Tension Breaker Tripped |  |
|---|---|---|---|---|

| Operation of relay, per cent overvoltage | 161 | 165 | 135 | 143 |
| Time for relay to operate, cycles | 79.5 | 47 | 111.5 | 88 |

*Lag.

The results of the previous tests show that very high voltages will be encountered when a machine suddenly loses its load. An overvoltage overfrequency relay was installed and connected in such a way that it would open the generator field switch and main generator breaker when the speed had increased 8 per cent and the voltage 25 per cent of the normal value, the relay operating at 108 r.p.m. and 8,250 volts.

*Effect of the Overvoltage Overfrequency Relay Operation.*—The operation of this relay is shown in Figs. 13 to 16 inclusive. From these test curves it is apparent that the relay did not function with sufficient speed to prevent the voltage from reaching high values. This time lag may be due to incorrect setting of the relay or to sluggishness in the relay mechanism, or both, as mentioned in the first part of this article. Since tests were made with only one setting of the relay, there are not sufficient data available to locate the trouble definitely. The voltage drops very quickly, however, as soon as the relay operates and there is only a lag of three cycles between relay closing and switch opening.

*Time of Relay Operation.*—In the above tests it was impossible to determine the sequence of operation of the overvoltage and overfrequency elements of the relay; therefore in order to get definite information on the time required for each element to operate and the actual percentage increase above normal value at which they operate, tests were made in which only one element at a time was used. The results are shown in Figs. 17 and 18, with the maximum values given in Table VI. It would seem from these tests that the overvoltage element is responsible for the delayed action of the relay.

*Decay of Generator Voltage When the Main Field Is Opened and When the Exciter Field Is Opened.*—The decay of generator voltage, plotted against time, when the main generator field is opened and when the exciter field is opened is shown in Fig. 19. In both cases the generator was running with no load and an initial terminal voltage of 6,600 volts.

*Time Constant of the Exciter Field.*—The building up and decay of the current in the exciter field are shown in Figs. 19 and 20, and from these curves the time constant was calculated. It takes about six seconds for the current to build up from zero to its final value, but when the circuit is opened, the current decreases much more quickly, because of the discharge resistance that is connected across the field when the switch opens. Since the current in the field is changing during the process of building up and dying down, the inductance of the windings will also change. A curve was plotted (Fig. 19) to show the relation of the ratio $L/R$ to time as the current builds up in the field. If the resistance ($R$) of the field is assumed to remain constant, the curve shows how the inductance ($L$) changes with time.

*Building Up and Decay of Current in the Generator Field.*—With the generator stationary, a voltage was impressed on its field by closing the field switch and an oscillogram of the building up of the current was taken. Likewise the switch was opened and an oscillogram was made of the decay of the current. The curves shown in Figs. 19 and 20 were plotted from these oscillograms. It will be noticed that when the field switch is closed the current suddenly increased to about 40 per cent of its final value and then fell off slightly before building up along an exponential curve as it should. Similarly, upon opening the field switch the current suddenly increased and then decreased very rapidly. This is caused by the discharge resistance of the generator field being momentarily connected in parallel with the field during part of the travel of the field switch; thus the discharge resistance is connected directly across the exciter terminals for a short interval of time.

*Effect of Shorting the Resistance in Series with the Exciter Field.*—The generator was running at normal speed with the field switch open. The exciter voltage was then brought up to 100 volts and the resistance in series with the exciter field short circuited. The result is depicted in Fig. 21 and shows that the exciter voltage will increase from 100 volts to 150 volts in a time interval of 70 cycles, or 1.166 seconds. The same test was made on the 1,200-r.p.m. motor-driven spare exciter and the results are also shown in Fig. 21. In this case the voltage on the spare exciter increased from 100 volts to 150 volts in 35 cycles, or 0.583 second.

TABLE VI—OPERATION OF RELAY BY ONE ELEMENT ONLY

|  | Low-Tension Breaker Tripped |  |
|---|---|---|
|  | Overfrequency Element, Fig. 17 | Overvoltage Element, Fig. 18 |
| Load dropped, kw | 17,500 | 17,350 |
| Power factor, per cent | 100 | 99.9* |
| Increase in low-tension voltage, per cent | 145 | 166 |
| Overspeed operated, per cent | 115 | ..... |
| Overvoltage operated, per cent | ..... | 160 |
| Time for relay to operate, cycles | 67 | 85.5 |

*Lag.

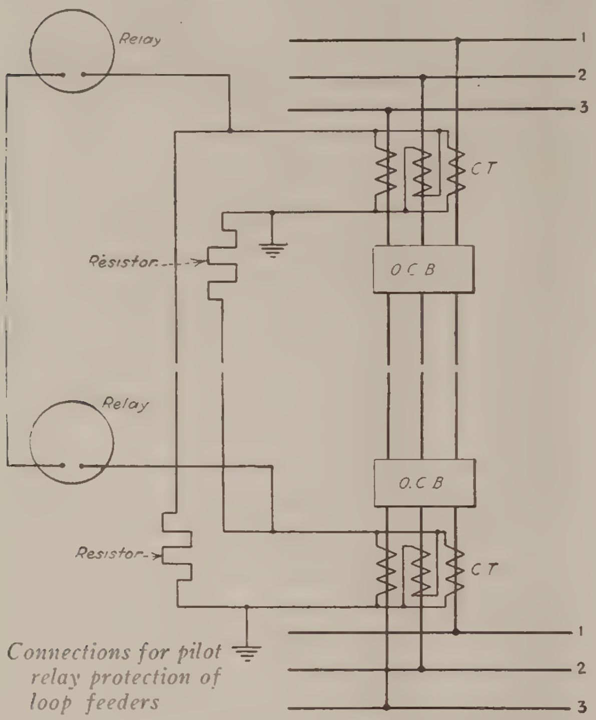
*Decay of Exciter Voltage When Exciter Field is Opened.*—In this test the generator was running at normal speed with the main field switch opened. The exciter voltage was adjusted to 250 volts, then the exciter field was opened. The time required for the exciter voltage to drop from 250 volts to 50 volts was approximately two seconds, the measurement being made with a voltmeter and stop watch.

*Effect of Main Field Series Resistance.*—With the exciter voltage held at 253 volts, all of the series resistance of the main field was cut in. The actual voltage across the generator field was thereby reduced to 75 volts, the current in the field was 220 amp. and the low-tension generator voltage was 5,700 volts.

## Pilot-Wire Relay Scheme

By Earl Baughn
*Engineering Department, Washington Water Power Company, Spokane, Wash.*

VERY often it is desirable to protect short sections of primary loop feeders by some sort of pilot wire relay scheme. A scheme suggested by W. H. Cole is described on page 661 of the Oct. 1, 1927, issue of Electrical World. A modification of this scheme has been developed for the loop feeders supplying an alternating-current network in Spokane. The connections used are shown in the accompanying diagram.



*Connections for pilot relay protection of loop feeders*

Under normal conditions there is a current flowing in the pilot wire loop equal to twice the current in any one current transformer secondary. There is no current in the relay operating circuit, since the two ends of this circuit are connected to points of equal potential. In case of a cable fault between the two groups of current transformers the current from one group is reversed so that it opposes that of the other. There are then two paths for the current, one through the relay operating circuit and the other from the ground on one current transformer group to the ground on the other. The total current divides inversely as the impedance of the two pilot wires in series to the impedance of the relay circuit including the relays.

This scheme has the advantage of eliminating the one to one ratio current transformer used by Mr. Cole, and also, by the reversal of the secondaries of one current transformer in each group, protection is secured against three-phase and single-phase short circuits, except between lines 1 and 3, in addition to line to ground faults. Three-conductor cables of the usual types as well as cable of the Hockstadter type may be used when protected with such a relay scheme. Relays should be of as small volt-ampere load as possible. In cases where the pilot wire conductors are very short it may be necessary to include small resistors of one-half to one ohm resistance to increase the impedance of the pilot wire conductors so that a larger proportion of the current will flow through the relays rather than through the ground connections upon trouble within the section of cable protected.

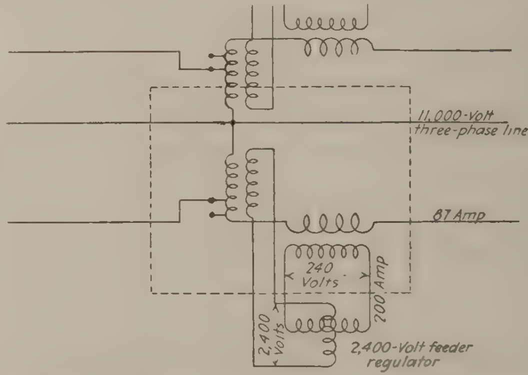
## 2,400-Volt Regulators Used for 11-Kv. Line

By E. F. Pearson
*Electrical Engineer Northwestern Electric Company, Portland, Ore.*

ADVANTAGES of using standard stock 2,400-volt feeder regulator equipment and a saving in cost over an 11,000-volt regulator led the Northwestern Electric Company to develop an ingenious scheme for regulating the voltage on an 11-kv. feeder. Two 200-amp. induction feeder regulators in conjunction with two special transformers, connected as shown in the accompanying diagram, give 10 per cent voltage regulation on an 11-kv., three-phase line.

Special four-winding transformers were built for the purpose by the Westinghouse Electric & Manufacturing Company. Two independent transformers contained in one case were placed on the same core. One is a series transformer with its primary excited from the 2,400-volt regulator and its secondary in series with the 11-kv. line. The other is a transformer with a tapped 11,000-volt primary winding to give a fixed boost by auto-transformer action and a 2,400-volt secondary winding to excite the regulators.

In the first installation made the regulator-exciting transformer was connected to give a fixed boost of 5 per cent. With this connection the regulator will buck the voltage 5 per cent to offset the 5 per cent fixed boost at light loads, so that the 11-kv. feeder voltage will be that normally impressed at the distant substation. At times of heavy load the boost of the regulator is added to the fixed boost, giving a total boost of 10 per cent. Any other combination of boost and buck may be had by selecting other taps on the auto-transformer winding.



*Four-winding transformer and 2,400-volt regulator used on 11,000-volt line*

A study of the problem when the scheme was first considered indicates that two single-phase regulating units, as described, would be preferable to a special three-phase transformer and a three-phase, 2,400-volt regulator. In considering this manner of regulation it was at first thought that there might be trouble with harmonic voltages, but this did not prove to be the case.

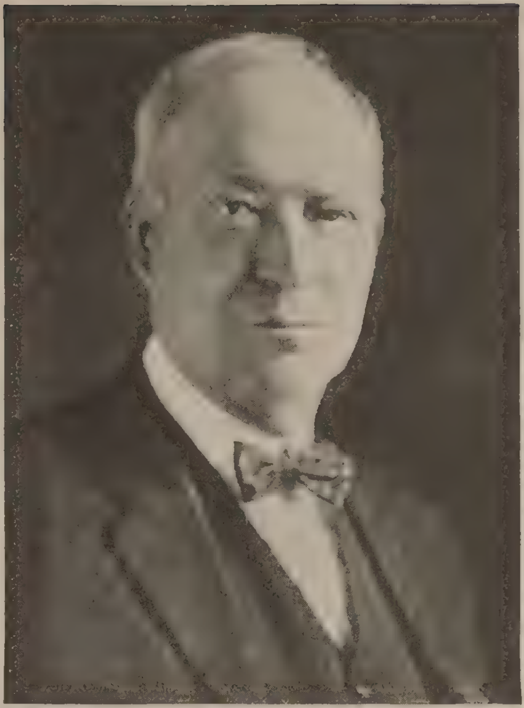
# Financial Set-up Simplified

### Subsidiaries of Buffalo, Niagara & Eastern system lose their identity in merger with the parent company

*Based on an Interview with*

F. D. COREY

*President Buffalo, Niagara & Eastern Power Corporation*



*F. D. Corey*

CONSOLIDATION or merger programs have been adopted by a number of the leading public utilities in recent months for materially simplifying their financial structures. Not infrequently existing franchises or the presence of uncallable securities have prevented a complete consummation of such programs. In the case of one representative company, the Buffalo, Niagara & Eastern Power Corporation, and its subsidiary corporations, engaged in the electrical business in the State of New York, the simplification process is complete and far reaching. The plan contemplates the consolidation into a single operating company of the Buffalo, Niagara & Eastern Power Corporation and its subsidiary corporations engaged in the electrical business in the State of New York, President F. D. Corey told a representative of the ELECTRICAL WORLD.

This unification into a single company presents less difficulties than many of the other power systems. The parent company as at present constituted is the holding company and owns practically all of the common stock of the subsidiaries. Furthermore, the preferred issues of the subsidiaries have been called and no restrictions or limitations appear to stand in the way of a complete consolidation of all of the above-mentioned companies. It is urged, and may be reasonably expected, that this unification or consolidation into a single operating company will reduce overhead very materially and result in a more economical and efficient operation of the properties. It is hoped that the unification process will be consummated at or near the end of the present calendar year.

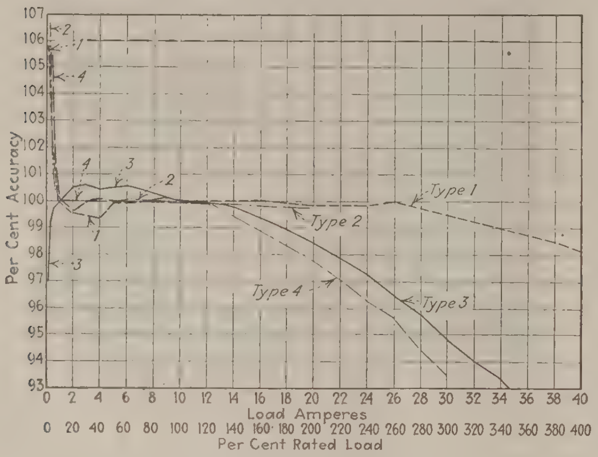
The first step taken in the proposed unification and reorganization plan was the authorization of an issue of 500,000 shares of first preferred stock without par value of the Buffalo, Niagara & Eastern Power Corporation. This step was consummated on April 2, 1928. Three hundred and fifty thousand shares of this issue will be used for the purpose of acquiring by exchange, or providing funds for the redemption of, the existing preferred stocks of the subsidiary companies. Such issues include 680,724 shares of preferred stock of the Niagara Falls Power Company, 497,785 shares of Niagara, Lockport & Ontario Power Company preferred stock and 4,568 shares of preferred A and 1,207 shares of preferred B stock of the Tonawanda Power Company. When the plan is completed the single company will be obligated for the entire funded indebtednesses of the group consolidated.

The reduction in overhead cost and the advantages accruing from centralized management need no special emphasis. It is obvious that a very substantial annual reduction in operating costs will be made. The actual saving in dividend charges will also be substantial. In the case of the Niagara Falls Power Company the present preferred issue is a 7 per cent one; the present Niagara, Lockport & Ontario Power company preferred issue is 6.4 per cent, and of the Tonawanda Power Company issues one is 7 per cent and the other is 6 per cent. Since the new issue is at the rate of $5 per share per annum, it is apparent that the actual money saving will be quite substantial.

In so far as the shares, or proceeds of shares, of first preferred stock are used for the acquisition or redemption of these subsidiary preferred stocks, their issue will somewhat increase the liquidation value of the securities which are senior to existing classes of stock of the corporation. At the same time it will materially increase the earnings available for dividends on such existing classes of stock and thus improve their position. The offer of an exchange of shares of the first preferred stock for outstanding shares of the subsidiary preferred stocks that has been made to the holders thereof enables them to receive an amount equal to the retirement or redemption price in shares of the new first preferred stock at the price of $95 per share. The portion of the 350,000 shares of first preferred stock not taken by exchange will be sold to provide funds to enable the subsidiary companies to retire or redeem their said preferred stocks at the retirement or redemption price thereof. Such retirement or redemption should be completed by June 30, 1928. From the foregoing it will appear that already substantial progress has been made in the carrying out of the program of unification and consolidation.

# Watt-Hour Meter Performance Improved with Low-Speed Elements

As a result of impartial tests with four types of watt-hour meters the load characteristic curves for sixteen instruments are represented in the accompanying figure. This information was presented by W. B. Brown, New Orleans Public Service, Inc., at the eighth annual convention of the Southwestern Geographic Division of the National Electric Light Association. Type 1 represents a low-speed, high-torque meter. Type 2 is a high-torque meter but a high-speed characteristic impairs its accuracy. Type 3 is a high-speed device rotating 100 per cent faster than type 1. Type 4 has a speed midway between that of 2 and 3. The most interesting feature of type 1 is that from approximately 4½ per cent rated load to 400 per cent rated load the meter registers within a limit of 2 per cent of perfect accuracy. This indicates a better development of the low-speed, high-torque principle which approaches the ideal condition of the 100 per cent performance curve



*Comparative performance of single-phase, two-wire, watt-hour meters*

# Remodeled Home Lighting Equal to Several Average Homes

By M. Luckiesh

*Director Lighting Research Laboratory, National Lamp Works, Nela Park, Cleveland*

The old houses needing remodeling have received little attention during relighting and rewiring campaigns. Perhaps it has not been generally appreciated that several million such houses exist.

Recognizing the possibilities in increasing the resale value and in increasing the comfort and convenience in these old houses by a moderate expenditure, *Household Magazine* sponsored the remodeling of a typical old house in Dixon, Ill., and we specified the wiring and lighting equipment.

This house was wired and equipped for a few hundred dollars. It was originally an eight-room house and typical of several millions of old houses in this country. No shade worthy of the term was found in it. The old and new equipment are listed in the following table:

| | Before Remodeling | After Remodeling |
|---|---|---|
| Convenience outlets | 0 | 24 |
| Wall brackets | 0 | 7 |
| Portable lamps | .. | 14 |
| Ceiling fixtures | 2 | 14 |
| Drop cords | 7 | 0 |
| Tungsten lamps | 11 | 69 |
| Connected load (watts) | 350 | 3,670 |
| Wiring outlets | 8 | 69 |

The remodeling of one such "old house" is the equivalent of adding several average homes (6½ rooms) to the central-station lines, as indicated below:

| | Remodeled Home | Average Home |
|---|---|---|
| Convenience outlets | 24 | 4 |
| Portable lamps | 14 | 3 |
| Utility brackets | 7 | 4 |
| Ceiling fixtures | 14 | 9 |
| Tungsten lamps | 69 | 27 |
| Connected load (watts) | 3,670 | 1,000 |

This is just the beginning of an activity which will prove profitable to all concerned. It will mean, to the householder, a home in exchange for a house and a few hundred dollars. It will mean increased lamp, fixture, wiring and energy sales to those concerned.

# Varnished Metal Baked at 2.4 Cents per 100 Lb.

"Our total cost for electric baking, 2.4 cents per 100 lb. of metal, is so low that we would not consider using gas or oil ovens with their increased fire hazard," states W. C. Kenney, president of the Kenney Manufacturing Company, Auburn, R. I., in connection with operating results obtained from an electric oven installation designed by C. I. Hayes, Providence, R. I. The above cost includes overhead. Two 30-kw. ovens are in service in this plant, which uses them in baking lacquer on tin plate employed in making curtain rods. The operating schedule calls for a one-hour bake at 250 deg. F. The ovens are operated single phase, but can be run on three-phase circuits if desired. The Kenney company further states that it finds no variation in the color of the work turned out, which means that every bake is the same and the temperature uniform throughout the oven.

*Uniform results and low costs led to purchase of duplicate oven*

# The Parable of the Range in the Parlor

A true story that has led to the standardization of heavier home services in many cities

By Earl Whitehorne

ONCE upon a time a certain salesman called upon the general manager of a certain power company. He knew him well. and when he came in the G. M. shut the door and began to tear his hair and curse the gas company. It was a sad, sad story he had to tell.

It seems that this general manager six months ago, in a sparkling moment, had one day in a much-advertised contest given away to a fortunate customer one electric range. It was a beautiful big range, replete with hot and cold folding doors, gold fingernails and all the latest improvements. It was delivered to the modest home of one John Doe and deposited in the parlor—for there was no room in the kitchen.

Now John Doe was delighted and so was Jenny and so were little Jack and the baby to have possession of this lovely thing. And John immediately sent for an electrical contractor to see about getting this fine and noble cook stove to work. The contractor found, of course, that the wiring in the little home of the Does would not carry a range and figured out an estimate on running a new service, a range circuit, installing the necessary switches, and so forth. The cost would be $65, he told John.

And then John said, "Why, what is all this $65 for?"

The contractor explained that John's service was inadequate. He had ¾-in. conduit, two No. 10 wires and a 30-amp. meter service switch. The first thing the contractor would have to do would be to tear out this old service and in its place install 1¼-in. conduit, three No. 6 wires and a 60-amp. meter service switch, and then run wires from the service up to the kitchen. The big cost of the installation would be the meter service.

"Well," John said, "I can't understand why big enough service wasn't put in at the time the house was built."

The contractor said, "Well, you're right. If it had been done then it would only have cost you around $15 instead of $65 to connect this range up now."

The range continued to encumber the parlor. This is a true story and the facts must be faced.

Now there came one evening to the home of the Does two friends to call. And the man friend said to John, "What's that there in the corner?"

"It's an electric range," said John, and he told them the wonderful story of how they won this hifalutin' and expensive luxury in a contest.

"Well, what's it for?" asked the friend.

"Why, to cook with," answered John.

"Well, what's it doing in here?" exclaimed the friend. "Why don't you put it in the kitchen and use it?" And then Jenny Doe explained, as wives will. They couldn't afford to rewire their house in order to connect it. Maybe they couldn't afford to use it. But they had it.

Well, to cut a long tale short, they all went out into the kitchen to look at the place where it might be put—as people do—and there was the old bedraggled gas range. And then the friend gave birth to an idea.

"Why don't you see if you can't exchange it for a new gas range?" said he. That was an exciting moment. So it was when the man came from the gas company. He also had an idea. Of course, they were not in the electric range business, but why did the Does want to fool with an electric stove that would ruin them if they ever tried to cook on it. Let's go right down and see some nice new gas ranges. Now here's this bee-utiful new gas cabinet range with extra double X enamel and nickel knuckles. It costs $150, but we will deliver it to your house and connect it up absolutely without charge and cart away your old black gas range and remove your despicable $350 electric range right out of the parlor. Who wants a range in the parlor anyhow? The idea! Thus the salesman.

And that is just what happened. And then next week in the big front window of the gas company was an interesting exhibit. A large gray electric range—in a gas window, mind you—and there was a great placard that read—"John Doe won this electric range in a contest. It cost him nothing. But he found that it would cost so much to have it wired up and then to use it that he came down here and bought a No. 17 Young Bride's Delight and asked us to take this off his hands"—or words to that effect.

And the general manager of the power company threatened and swore. And his friend the salesman said, "Wait a minute, I know the gas man. Let me go and see if I can't straighten it out. And he went and he did.

### Service Inadequacy

And then this salesman got to thinking and he went back to his friend the general manager of the power company and told him that the fatal electric range was no more in the gas office window. And he asked him a question. "Why is it," he said, "that this kind of thing can happen, that a man can win a beautiful electric range and take it home delighted with it and then not be able to use it and finally throw it out and pay his fuel money to the gas company? What's wrong with us in the electrical industry?" And then he told him.

"Did it ever occur to you," he asked the G.M., "that through the 40 years we electrical men have been connecting houses to the power systems of America—until we've got some seventeen million and a half—that in practically every house we have deliberately blocked our future market? Consider these four things:

1. When the gas company takes on a customer it installs a service and a meter. In the beginning there may be just a small range in the kitchen. But later if the customer decides to have a gas water heater or a gas radiator he simply installs it and connects it. The meter and the service are adequate.
2. When the water company runs a service to a house and sets a meter there may be only one bathroom and a kitchen sink. But

later if the family wants two more baths and a downstairs toilet there is no trouble about it. The service and the meter are ready. There is no need to go to the city for a permit and to pay for a bigger main and a more costly service. You use the water that you want.

3. And just so, when you have a telephone put in, your idea is that you desire to talk to other people in your town or in a nearby town or city. But suppose you wish to call Chicago, or New York, or San Francisco, or even London, are you compelled to ask the company for a different instrument, a bigger service and a special preparation for this broader, unexpected use of your telephone? You are not. You take the receiver down and just say, "Give me Chicago 41144," and you get it.

4. But when you apply for our electric service, your home is wired and you make application to the power company. The contractor installs a 30-amp. service entrance switch. The utility sets a 15-amp. meter, perhaps. Everything is lovely—until some day you and your wife decide to cook electrically. And then you find that though you can have plenty of gas for a water heater, or plenty of water for another bathroom or can talk to Florida through the same telephone you had put in to chatter round the town, when it comes to electricity all is very different. For the great electrical industry is not accustomed to have people ask suddenly to use more service than they expected. In fact, the great electrical industry hasn't been organized with any such idea in mind.

"And so in all America any large additional use of electric service is barred because the service arrangements and the meter, having no imagination of their own, have not expected it and are not ready. And if John Doe or Mrs. Mary Brady want to use an electric range they must call for a contractor and rewire their house, and put in heavier copper up to the range. For the electrical industry gives warning that it permits no man or woman to change his or her mind and cook by electricity unless he or she pays perhaps $40, or in some towns $90 or more, to change the wiring. It has never occurred to electrical men that the service entrance might be made ready in advance."

### Better Standard

That's what the salesman said. And the general manager thought a while and he said, "I guess you're right. I'd never thought of it before."

And then the salesman said, "Why don't we put an end to this condition in this town by standardizing at least on a 60-amp. service entrance so when somebody wants to use a range, at least the service will be ready, and there will only be a very small expense to run a circuit to the kitchen?"

And the general manager agreed and they called a meeting of all the local contractors and the inspectors and everybody interested and before long there was established in that city a new ruling that has standardized the 60-amp. service capacity—ready to serve.

And filled with zeal from this experience, this salesman has been preaching this gospel in other cities and getting other groups together, and out of this work has come a movement. The idea has been planted in many minds and it looks as though in many cities they are going to tear down this old barrier to the increased use of electricity by standardizing on a minimum service capacity of three No. 6 wires and a 60-amp. service switch on all services in their jurisdiction. At the present time in Grand Rapids and Lansing, Mich., they now have rulings of this nature in effect. A letter which I received recently from a Grand Rapids electrical man said: "I want to add that our 60-amp. rule is working out fine and every one is satisfied."

But it has not been easy. In some sections there is the most determined opposition on the part of the power companies. It has never been done. It is not necessary. People are not using ranges. It will make house wiring more expensive. These and a dozen other reasons are thrown up. But none of them can stand against the cold logic that bids the electrical industry remove these barriers that now prevent the greater use of electricity for cooking and for water heating.

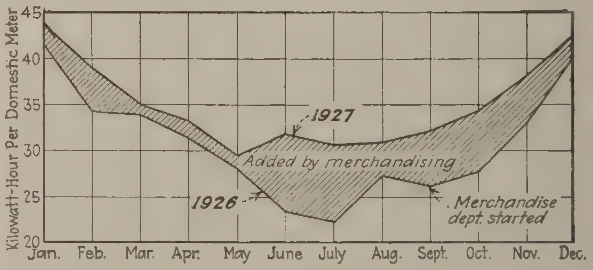
It is about time that we exposed ourselves to the possibility that some day the Johns and Marys in these houses will desire and have the right to cook and heat their water electrically. Forethought and preparation are highly regarded in most instances. Must the electrical industry deny itself the opportunity to profit by this good old axiom in so many homes? Is our vaunted readiness to serve to be so easily confounded?

No. It is high time for us in the electrical industry to join this adequate service movement and begin automatically to provide our customers with an adequate service when a home is built or a building is wired. Then there won't be any more ranges reposing in the parlors.

## Revenue per Meter Increased by Merchandising

THAT the kilowatt-hour consumption and revenue per domestic customer is increased directly as the result of efforts on merchandising is shown in the experience of the Southwestern Gas & Electric Company, of which Edwin W. Vennard is general commercial manager. This company is a firm believer in concentrated merchandising activities because it has followed closely its effect upon the residential use of energy in the towns served and can see the concrete benefits in increased domestic revenue.

The accompanying chart shows the increase in the domestic kilowatt-hour consumption for 1927 over 1926 in Shreveport, La., which is the largest community served by the company. In 1926 the average consumption per meter per month varied from 42 kw.-hr. in January down to approximately 22 kw.-hr. in the summer time. In September, 1926, a merchandise department was installed in Shreveport and aggressive appliance selling was commenced. Results have been most gratifying, as shown by the increase of 7½ kw.-hr. per domestic meter in 1927 over 1926. The two curves indicate this very clearly, particularly the increases during the summer months following a very active campaign on electric fans. Based on an average rate of 7½ cents per kilowatt-hour the revenue increase from 12,000 meters in July, 1927, was approximately $6,800.



*Effect of merchandising upon kilowatt-hour consumption per domestic meter*

The energy consumption in July, 1927, increased 7½ kw.-hr. per meter over July, 1926. Based on 7½ cents per kilowatt-hour, the total revenue increase for 12,000 meters was $6,800.

*Variable speed motors increase paper cutter output 33⅓ per cent*

# Paper-Mill Motorization

## *Improves Production and Quality*

Keen competition has made it necessary to devise new ways of automatically controlling product and cost of making it

By R. S. Lowry
*Formerly Electrical Engineer Champion Coated Paper Company,*
*Now Chief Engineer Ingalls Stone Company, Bedford, Ind.*

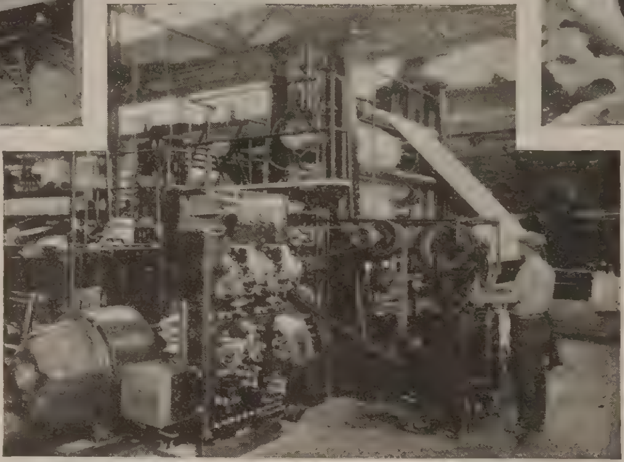
MANY changes have been made in paper-mill machines and in the method of driving and controlling them which tend to take much of the human element out of paper making. It is this human factor which interferes to a large degree with the production of a uniform quality and which also tends to make for varying costs in the production of the same grade of paper over long periods of time. Although some human supervision will always be needed, "feel" and sight enter so much into the making of paper, even at the present time, that uniformity of quality is hard to guarantee without considerable "waste" and time loss after repeated trials to meet certain specifications. The use of various meters is helping to eliminate what might be termed guesswork. They determine the quality of the stock and the ingredients which go into the product, giving the same results regardless of who is observing readings.

Proper motorization of individual machines not only tends to save power but places machines so perfectly under the control of the operator that he is able to obtain results not possible with other methods of driving.

Stock pumps driven by motors may actually affect in an indirect way the quality of the stock handled, for it is possible to vary the speed of the motor to suit the amount of stock to be delivered to the machine and thus reduce the amount returned to chests or agitators. The circulating of an unnecessary amount of stock besides wasting power has a deleterious effect on the stock. In many cases the pump may actually be shut down at times with resultant savings and benefit to stock. By placing an ammeter on the pump motor it is possible to tell the condition of the pump and the piping system and thus foresee trouble which might later interfere seriously with production.

Motorization of the beater engines has taken a great amount of the human element out of paper making. A motor on each beater makes for greater flexibility, saves power and might almost be considered an absolute necessity if it is desired to know exactly what goes on in the beater. A meter will tell very closely how "hard the roll is on the plate." The exact pressure cannot be told by sound. The accompanying chart serves to illustrate how far wrong a beaterman may be in attempting to set the roll by sound.

A beater roll which rests on the bedplate too firmly will not give as good results, so far as treatment of the stock is concerned, as one which rubs the plate firmly but allows the bearings to take part of the weight of the roll. Motorization tends to check overfurnishing of the beater or too great a change in stock consistency. Overfurnishing of the beater prevents proper circula-



*Top, left — Direct-current motors on platers double output*

*Top, right — Sectional drive of book paper machines*

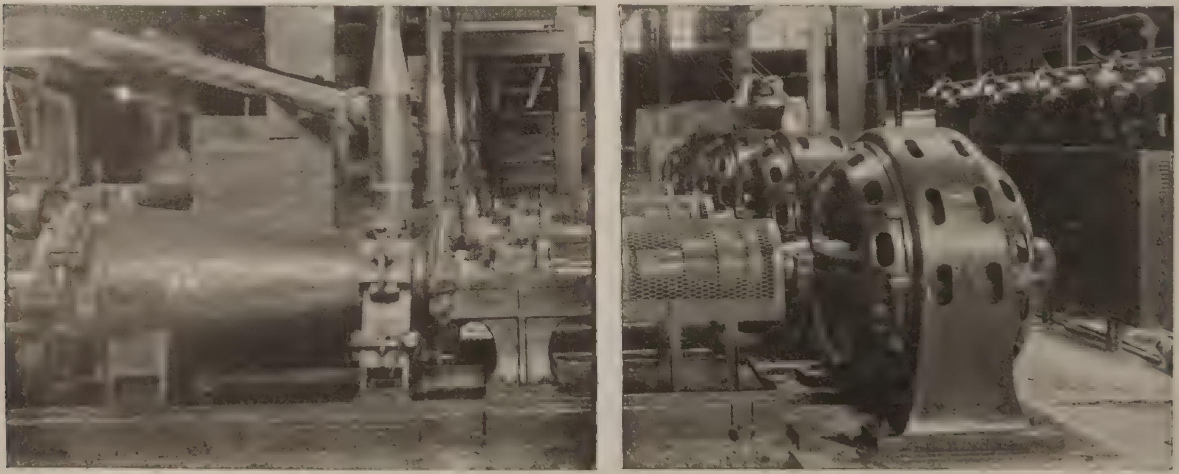
*At left—Super-calender driven by single direct-current motor allows high speeds*

tion of stock with consequent heating and non-uniformity of treatment.

Probably no machine in the paper mill has a greater influence on the power bill than the beater. It can be considered as an enormous brake in the hands of men not greatly interested in saving power. Even motors 100 per cent larger than necessary for proper beating can easily be stalled by a careless beaterman unless the control is equipped with proper protective apparatus. Here is where the motor with its meters proves valuable.

The Jordan engine has lent itself admirably to motorization and here the quality of stock is also affected by the method of drive. This is an ideal application for the synchronous motor, which holds the Jordan absolutely to one speed for all loads and insures uniform treatment of the fibers for any setting of the plug. A wattmeter indicates the pressure of plug against shell and much more accurately than depending on sound. A badly worn plug or shell will cause the power to mount high and the relays may even operate to remove the motor from the line. When this condition of plug and shell exists the stock will probably not be "short" enough and the meter indications are proof positive of what the trouble is.

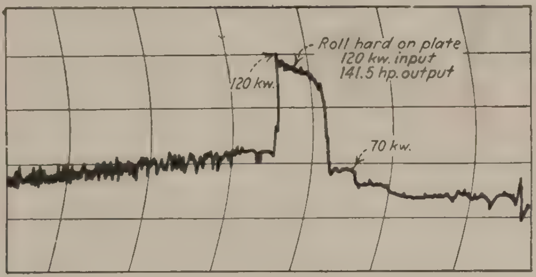
Sectional drive of paper machines is now out of the experimental stage and here the electric motor performs admirably to improve the quantity and quality of the output. The advantages of the sectional drive are numerous and in some respects revolutionary. Due to smooth starting and running and to the fact that at all times the amount of pull on the "wire" of the Fourdrinier is accurately known from meter indications the life of the wire will often be doubled or trebled. Should the stock in the wire be too "slow" or contain too much water, necessitating too high a vacuum or too many "flat boxes," the meter on the motor will indicate an abnormal



*Battery of four Jordans driven by synchronous motors* load. Conversely, the above condition would be indicated by an abnormal load on the motor. The "draw" between the various sections can be accurately adjusted and also can be calculated from meter readings. At the dry end of the machine the paper has its maximum strength in tension. It is frequently a question of dispute between machine tenders whether the draw is right between the last drier and first calender sections. It seems that no two men judge alike, but a glance at the meters on a sectional drive will settle the dispute.

The writer recollects a case where the paper was snapping off at the first calender. By quickly taking meter readings and calculating the horsepower being transmitted by the sheet and getting it down to pounds pull it was found the paper was actually under a tension of 130 lb. per foot of width, which was nearly double the required breaking strength for the grade.

Separate motors on each section of a paper machine also segregate bearing and other troubles causing abnormal loads. As an illustration one machine normally required 70 amp. on the first drier section. One day the load increased to 75 amp. and on the following day, which happened to be Saturday, the ampere load had increased to 80. Converted into horsepower this increase in amperage was equivalent to only about 2 hp. On Sunday morning, with the machine down, each bearing on the first drier section was carefully examined. On the back side of the machine on one of the drier rolls, where it was impossible to get at the bearing with the machine running, a bearing was found entirely lacking oil. The bearing and journal had not been cut as the meters, having shown up trouble with such a small increase in power, had made it possible to locate the trouble before any damage was done. With other types of drive the trouble would hardly have been located until the bearing smoked, which might possibly have meant a shutdown and attendant loss of production.



*Guesswork expensive in beater operation*

After power readings had been taken of the beater and the roll setting pronounced right to give the desired results the roll was raised and the beaterman asked to again set the roll at the same point. With the correct setting the motor was taking only about 70 kw., while after resetting the roll the motor pulled 120 kw., or an overload of 71 per cent.

Super-calenders driven from line shafts are far out of date and unsatisfactory. Often the breaking of the sheet on one calender will cause the paper to snap off on one or more of the other calenders operated from the same line shaft. Speeds as high as 1,000 ft. per minute are now attained by proper motorization. Needless to say, the calender must be under perfect control at this speed or should the paper break there would be a great amount of waste and the cotton or fiber rolls of the stack might be damaged.

With a calender drive lately developed it is possible to stop the stacks within 10 ft. of paper or before a "tag end" can enter the stack, and this from a speed of 1,000 ft. per minute. This higher speed means an increase in output of 60 per cent to 75 per cent over line-shaft drive or even some of the old types of motor drive. The adjustable speed motor allowing a range in speed from 30 ft. per minute to 1,000 or more feet per minute permits the operator to run the calender at the speed best suiting the grade of paper. Furthermore, waste, due to breaks, can be practically eliminated.

### PLATER ELECTRIFICATION SPEEDS PRODUCTION

Probably the most startling effect of motorization on production occurs in electrifying a plater. This machine consists of two chilled rolls which are caused to run alternately forward and backward by the driving mechanism. In the case of a motor-driven machine the motor is simply reversed after being "plugged." Before passing through the plater rolls the sheets of paper or cardboard are placed between alternate sheets of zinc in stacks ranging from about 1 in. to several inches in height. This stack is then passed back and forth between the rolls under enormous pressure, the zinc sheets imparting a special finish to the cardboard.

With the original line-shaft drive the operator was able to keep only one crew of three girls busy stacking and unstacking the sheets. The motor drive and its control speeded up the machine to such an extent that another crew of girls was placed at the operator's right. The output was doubled, or, in other words, one machine did the work of two.

Paper cutters run by adjustable-speed motors with push-button control will immediately show an increase of output of from 25 per cent to 33⅓ per cent, depending on the operator. Where a number of cutters side by side have been properly motorized the factor of rivalry between workmen enters in so strongly that the increase in output is often amazing. Each operator is interested in seeing his or her pile of paper grow faster than his neighbors' and new interest is taken in the work. Certainly there is no better way in the world of getting an increase in output. The process is automatic.

This is the age of speed and, given the correct equipment, the workman carries the tendency right to his work and enjoys it to the mutual benefit of himself and his employer. With correct equipment the workman produces more with the same or less energy expended and it has not cost him anything. He is better off and so is the industry.

## A Freak Cause of Service Outage

THE list of freak causes of trouble on electric systems continues to grow. The switch on a 4,800-volt power line of a large Middle West company opened automatically at 4:32 one morning recently and service on the line was interrupted for three minutes. Two phases were found burned open and the third conductor badly damaged at the trainer leads to a transformer bank serving an industrial customer. Temporary repairs restored service to this customer at 6:55 a.m. The trouble later was found to be due to a felt ball about 12 in. in diameter which had been used by workmen on a job in the vicinity for a game of basketball, probably during their noon hour, the loops to the transformer being used as a basket. The ball was left lying in the loops, presumably for several days, and, becoming rain-soaked, caused an arc-over between two leads, burning them open. The wire was No. 00, rubber covered.

# Trend of Electrical and General Industry Compared

A COMPARISON of the viewpoint of executives of the electrical industry and executives of industry in general is shown in the accompanying tabulation. In a study to develop trends in general industry the Sherman Corporation, Boston, asked executives of all manufacturing concerns to check a list of factors as to whether they were, in the case of the reporting company, favorable or unfavorable. Another list showing the trend of practice in industry also was checked.

It is clear that the electrical industry considers competition, overproduction, profit margins, surplus plant capacity, selling and distribution expenses and hand-to-mouth buying as the outstanding unfavorable items. General industry, on the other hand, looks on none of these items as unfavorably as does the electrical industry. In the case of competition, only 9 per cent of general industry considers it unfavorable, compared to 91 per cent that looks upon it as favorable. On the other hand, 67 per cent of the electrical industry considers competition unfavorable and none considers it favorable, the remainder giving no definite answer.

In addition to the tabulated data some interesting statements from manufacturers in the electrical industry were received by the Sherman Corporation. These electrical industry executives reported their judgments as to what they believed are the problems of business in 1928. Some of the opinions are as follows: A manufacturer of lighting equipment says he considers as the major problems in his industry for 1928 intensive selling, cutting down overhead and less volume and greater profit.

A manufacturer of electrical products declares that distribution, research, employer-employee relationships are the principal problems in his industry.

A manufacturer of electrical welding rings, rims, bands, angles and flanges says that he finds his principal problems are further reduction in manufacturing costs and domestic and foreign competition.

FAVORABLE AND UNFAVORABLE FACTORS IN INDUSTRY

| Factor (General Conditions) | General Industry Per Cent Favorable | General Industry Per Cent Unfavorable | Electrical Industry Per Cent Favorable | Electrical Industry Per Cent Unfavorable |
|---|---|---|---|---|
| 1. Money rates | 98 | 2 | 67 | 00 |
| 2. Employee relationships | 93 | 7 | 67 | 00 |
| 3. Labor efficiency | 84 | 12 | 67 | 33 |
| 4. Credits | 84 | 16 | 100 | 00 |
| 5. Wage scales | 81 | 19 | 67 | 33 |
| 6. Collections | 74 | 26 | 100 | 00 |
| 7. Development of new products | 74 | 26 | 67 | 00 |
| 8. Commodity prices | 69 | 31 | 33 | 33 |
| 9. Inventory turnover | 67 | 33 | 33 | 33 |
| 10. Mergers | 65 | 35 | 33 | 00 |
| 11. Style | 62 | 38 | 00 | 00 |
| 12. Agricultural conditions | 55 | 45 | 00 | 00 |
| 13. Political developments | 54 | 46 | 00 | 00 |
| 14. Capital turnover | 54 | 46 | 67 | 33 |
| 15. Weather | 51 | 49 | 33 | 00 |
| Factor (Special Conditions) | | | | |
| 1. Competition | 91 | 9 | 00 | 67 |
| 2. Competition from within industry | 87 | 13 | 33 | 33 |
| 3. Overproduction | 87 | 13 | 00 | 67 |
| 4. Profit margins | 77 | 23 | 00 | 100 |
| 5. Limited markets | 77 | 23 | 00 | 00 |
| 6. Federal taxation | 77 | 23 | 00 | 00 |
| 7. Competition from outside industry | 76 | 24 | 00 | 00 |
| 8. State taxation | 72 | 28 | 00 | 33 |
| 9. Surplus plant capacity | 69 | 31 | 00 | 67 |
| 10. Foreign competition | 67 | 33 | 00 | 00 |
| 11. Local taxation | 65 | 35 | 33 | 33 |
| 12. Installment selling | 63 | 37 | 33 | 00 |
| 13. Government regulation of business | 62 | 38 | 00 | 00 |
| 14. Selling and distribution expenses | 59 | 41 | 00 | 67 |
| 15. Hand-to-mouth buying | 59 | 41 | 00 | 100 |

TREND OF PRACTICE IN INDUSTRY

| Have You | General Industry Per Cent Yes | General Industry Per Cent No | Electrical Industry Per Cent Yes | Electrical Industry Per Cent No |
|---|---|---|---|---|
| Reduced unit manufacturing costs | 73 | 27 | 84 | 16 |
| Reduced overhead | 56 | 44 | 40 | 48 |
| Reduced sales expense | 29 | 71 | 42 | 58 |
| Reduced selling price | 54 | 46 | 58 | 33 |
| Reduced number of items | 27 | 73 | 33 | 56 |
| Increased number of items | 44 | 56 | 33 | 66 |
| Purchased new machinery | 70 | 30 | 75 | 17 |
| Increased inventory turnover | 60 | 40 | 58 | 33 |
| Increased capital turnover | 46 | 54 | 33 | 58 |
| Cut down manufacturing time | 52 | 48 | 75 | 25 |
| Carried on product research | 61 | 39 | 75 | 08 |
| Carried on process research | 61 | 39 | 67 | 25 |
| Carried on market research | 56 | 44 | 67 | 25 |
| Developed new merchandising plans | 52 | 48 | 92 | 08 |
| Increased sales volume | 52 | 48 | 25 | 67 |
| Improved quality | 82 | 18 | 83 | 17 |
| Cut quality | 1 | 99 | 00 | 92 |
| Changed wage methods | 13 | 87 | 00 | 92 |
| Revised wage scales—upward | 16 | 84 | 17 | 83 |
| Revised wage scales—downward | 17 | 83 | 08 | 92 |
| Has advertising appropriation been increased | 34 | 66 | 50 | 50 |
| Has advertising appropriation been decreased | 20 | 80 | 25 | 75 |
| Have there been major changes in personnel | 14 | 86 | 25 | 42 |
| General management | 16 | 84 | 17 | 25 |
| Sales executives | 23 | 77 | 42 | 17 |
| Production executives | 22 | 78 | 17 | 25 |
| Have you had merger under serious consideration | 20 | 80 | 00 | 75 |

NOTE—Where the "Yes" and "No" percentages, for any one factor, do not add up to 100, it is because some of the matters were not reported on.

A manufacturer of electric motors and generators says that his problems are sales, manufacturing costs and prices.

A manufacturer of electrical specialties reports that the matter of maintaining or increasing sales without driving sales costs out of line will be the big problem in 1928.

A manufacturer of electric appliances feels that the matter of maintaining volume at a better rate of profit will be his major problem.

A few of the statements made by manufacturers in the electrical industry, outlining the basic causes of the increase or decrease in profit margins, may be of interest and are as follows:

*Reasons for Increased Profits:* Electrical products—"Improved manufacturing methods."

Electrical specialties—"Price reductions and increased sales work."

Household appliances—"By manufacturing items formerly purchased, lower labor costs even at a higher average wage scale, and slightly increased sales volume."

*Reasons for Decreased Profits:* Electrical equipment—"Sales volume decreased about 10 per cent; sales price decreased about 10 per cent; we have not thought it wise to decrease our burdens to correspond with decreased volume and price; only reductives are such as naturally accrue from decreased production."

# Creating Favorable First Impression

REALIZING that first impressions are often lasting and that many an electric range, electric refrigerator or other appliance is in disrepute with the customer because of some misunderstanding or lack of information concerning its use, H. H. Courtright, manager of the merchandising division of the San Joaquin Light & Power Corporation, has adopted a means of eliminating the possibility of unfavorable first impressions of electric refrigerator purchasers.

Before delivering a refrigerator it is thoroughly inspected and tested and delivered with the coils frosted, or at least very cold. No trays are delivered with the refrigerator. The installation man mentions this to the housewife and tells her that a salesman will come with the trays as soon as the machine is set up. Following the installer comes the salesman with the trays. The ice tray is filled with ice cubes and the dessert tray with a frozen pudding ready to be served. An apology is made for not having sent the trays with the machine, but the salesman suggests that the housewife may be glad to have the ice cubes ready when her husband comes home. Also he mentions the fact that there is enough frozen dessert for two families and suggests that perhaps she would like to show her new machine to the neighbors and have them taste the frozen dessert.

This delights the housewife and she calls in the neighbors and treats them to some of the dessert and the refrigerator is "sold" from the time it enters the house. This plan was adopted because it was found that the trays often have an invisible film of oil on them from the stamping process and if they are not thoroughly cleaned the first batch of ice cubes will taste of oil and the refrigerator will prove a disappointment to the whole family. The first experience with frozen dessert may likewise prove unsatisfactory. The method adopted by Mr. Courtright eliminates these possibilities and gives him an opportunity to improve the company's relations with its customers and often develops prospects for other sales.

## Appliance-Use Table Answers Cost Queries

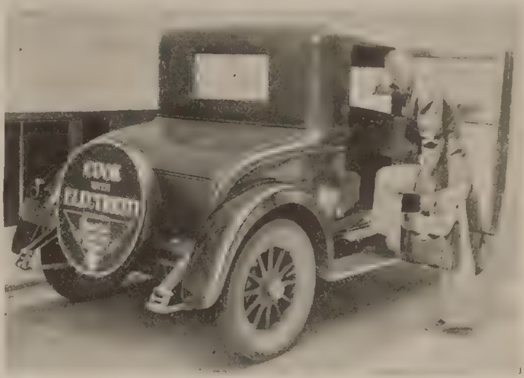
By Willard Allphin

*Fall River (Mass.) Electric Light Company*

TO ENABLE residential service customers quickly to estimate the cost of using various leading appliances on the Fall River Electric Light Company's new household rate a table has been prepared showing how much each appliance adds to the previous monthly bill over a wide range of values. The residential service rate referred to is as follows: First 25 kw.-hr. per month, at 8 cents each; next 75 kw.-hr., 5 cents each; over 100 kw.-hr., 3 cents each; minimum charge, \$6 per year. Thirty thousand folders, 8⅜ in. x 10¾ in. in size, have been printed carrying this table with an illustrative application.

## Tire Cover Is Silent Salesman for Electric Cooking

ONCE a thing has become an established fact in the minds of customers there is rarely any question as to its value or practicability. The Valley Electrical Supply Company, merchandising subsidiary of the San Joaquin Light & Power Corporation, believes that by equipping 250 automobiles of the two companies with tire covers advertising electric cooking a state of consciousness will be created in the public mind that will bring about a better understanding of the salient facts regarding electric cooking.



*Electric cooking message on 250 company automobiles*

These 250 cars traversing the entire system with their tire covers are silent salesmen and act as constant reminders of the fact that there is a special rate for electric cooking; that it is clean, cool and economical. The tire covers are also a means of identifying salesmen and it has been found that the men are taking particular pains to park where the sign will be most conspicuous.

The copy on the cover is brief and the design and color scheme are planned to gain the most in readability.

*Message from Fall River Electric Company to Its Customers*

In using this table, use the new total each time you add an appliance. For example, suppose your average bill at present is \$1.35 and you wish to know how much it would be if you added a refrigerator, a range and a washing machine. In the column headed \$1.25 to \$1.50, we find that the refrigerator will cost approximately \$2.70 a month. Adding this to \$1.35 gives us a new total of \$4.05. In the column headed \$4 to \$4.50, we find that a range for three people will cost approximately \$3.55. Adding this to the \$4.05 gives us a total of \$7.60. Since the new bill is over \$5.75, the washing machine will cost approximately \$0.03 a month to operate, or a grand total of \$7.63 for all electric service.

We suggest that you save this folder for future reference, and if you have any further questions please feel free to call on us to telephone 1730—Power Department.

| If your present monthly bill is from. | \$0.50 to 0.75 | 0.75 to 1.00 | 1.00 to 1.25 | 1.25 to 1.50 | 1.50 to 1.75 | 1.75 to 2.00 | 2.00 to 2.25 | 2.25 to 2.50 | 2.50 to 2.75 | 2.75 to 3.00 | 3.00 to 3.50 | 3.50 to 4.00 | 4.00 to 4.50 | 4.50 to 5.00 | 5.00 to 5.75 | Ove 5.75 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| The cost per month of operating an Electric range, one to three people will be about | 5.30 | 5.15 | 5.00 | 4.85 | 4.70 | 4.55 | 4.45 | 4.30 | 4.20 | 4.10 | 3.95 | 3.75 | 3.55 | 3.35 | 3.10 | 3.00 |

# Bills as Messengers*

By H. T. East
*Assistant to Vice-President*
*Public Service Company of Northern Illinois*

The electric service bill may be considered as merely a statement informing the consumer of the amount due the company for the preceding month or it may be looked upon as a periodic contact with each and every patron of the company. If the bill is regarded as a monthly customer contact, as it certainly should be, the natural tendency is to study the messenger and carefully consider the means of improving it. Bills which are neat, accurate, distinctive and clear help produce good will and offset, to some extent, the unwelcome feeling which the receipt of any communication calling for a cash expenditure naturally produces in the mind of the none-too-eager recipient thereof.

### Information Bill

It is considered good practice to show all or nearly all of the following data:

Name and address of company.
Where bills may be paid.
Name and address of customer.
Customer's account number or other account identification.
The date the bill was issued.
The date on which the discount expires.
Actual dates of present and previous meter readings.
Present and previous meter index.
Total kilowatt-hours used.
Kilowatt-hours charged at each rate.
Gross bill.
Discount.
Net bill.
Unpaid previous bills.

The addresses of local offices, stores and other authorized collection agencies may also be shown. Bills covering more than one month's service should be plainly marked.

### Rate Schedules on Bills

Since it is impossible to check the computation used in determining the total bill without the rates, they are usually printed on the back of the bill. The discount or additional charge must also be quoted. If the rates vary in different sections it is difficult and unpolitic to show them unless separate bills are used for each section of the territory. If the schedule is such that a few sentences of explanation will enable the customer to understand the application of the rate, it seems desirable to show it on the bill. If a brief explanation will not serve the purpose, such information must be omitted.

### Unpaid Bills and Merchandise Items

Space must be provided for showing previous unpaid bills. Companies which make a practice of billing merchandise payments on the service bill must also provide space for such entries.

### Messages on Bills

It is not uncommon to include a small merchandise advertisement on the monthly bill, but opinion on this matter has not been crystallized.

Bills are also used as a medium for carrying messages such as warnings against permitting unidentified company representatives to enter premises, instructions as to how to read meters, announcements of store openings, changes in rates, new policies, or service messages designed to promote public relations.

## Four Cardinal Points in Rural Service

1. Rates especially developed to meet rural conditions.

2. A rural service department where the responsibility for the development is placed.

3. Minimum line construction costs consistent with economical upkeep.

4. Development of a selling program which will place reliable information in the farmer's hands.

Dr. E. A. White,
*Director National Committee on the Relation of Electricity to Agriculture.*

# Letters from Our Readers

## *Motor Starting Current Vs. Lighting Flicker*

*To the Editor of the* Electrical World:

I do not believe that Mr. Johnson is in real disagreement in regard to my article, upon which he comments in the April 28 issue of the Electrical World. In his illustration the motor at $M$ has but a two-way feed from each of two directions along the mains $AA'$, although at the points $A$ and $A'$ there is a four-way feed resulting from the network of three sets of mains and a transformer bank at these points. Mr. Johnson combines all the cable and transformer impedances from all the included banks to the motor $M$; that is, he sets up the condition equivalent to a one-way feed.

Applying the approximate formula $IR \cos \phi + IX \sin \phi = 2$, substituting $R = 0.00303$ and $X = 0.00696$ ohms, the value of $I$ becomes 276 amp. for 15 per cent power factor, as against 270 amp. as determined by him.

For two-way feed Mr. Johnson's values of combined impedance would be doubled and the value of $I$ halved, but since a two-way feed is now being considered the allowable motor current becomes $2 \times I/2 = I$ as before. Mr. Johnson has merely made too literal an interpretation of my memorandum.

H. L. Wallau,
Electrical Engineer.
Cleveland Electric Illuminating Company.

## *Senility, Not Sensibility*

*To the Editor of the* Electrical World:

In setting up the copy of my letter appearing on page 1302 of your June 16 issue the printer has thrown my thought 90 degrees out of phase by using the word "sensibility" instead of "senility." Of course it is not necessary to point out that "sensibility" means mental receptivity, discernment, etc., while "senility" is a "horse of another color."

H. W. Young,
President.
Delta Star Electric Company,
Chicago, Ill.

# Digest of Electrical Literature

## Hydro-Electric Development and Steam Equipment

*Progress in the Burning of Coal.*—A. G. Christie.—As the result of an examination and analysis of contemporary practices in the combustion of coal the author has arrived at a number of conclusions regarding future developments in this field. Several influences are credited with bringing about the recent progress in the combustion of coal, namely, increased furnace size and better combustion conditions, increased furnace temperatures, a better appreciation of the effect of radiant heat transfer, a better appreciation of equipment and furnace requirements for various coals, improvements in stoker design, improvements in powdered coal systems and better instruments and improved furnace control. It is anticipated that furnace sizes will not be decreased and may be increased. Higher fuel-burning capacities of furnaces will be secured by better firing methods, further mixing of gases in the furnace and, in the case of stokers, improved methods of distributing air to the fuel bed. The use of preheated air will be extended, according to the author. New furnaces will aim to secure the highest furnace temperatures possible to assure rapid and efficient transfer of heat. These and many other essential fundamental characteristics have been considered by Professor Christie. — *Engineers and Engineering,* May, 1928.

*High-Pressure Steam Boilers.*—G. A. Orrok.—The lines of further investigation which apparently offer the greatest possibilities in the future design and construction of high-pressure steam boilers have been completed by the author. Among the factors discussed are: The effect of tube inclination; the circulation problem, releasing surface and steam space; safety in operation; increase in capacity; boiler materials, temperature margins, and stresses in superheater tubes, riveted drums and headers. It is developed that a high-pressure boiler must consist largely of banks of tubes; headers in great variety are available up to at least 1,400 lb. pressure; drums must be of small diameter and should not contain over 10 per cent of the water content of the boiler; below 1,000 lb. there is no need of employing alloy steels, but above that pressure such steels are available and should be used if the temperature margins so require; for superheats higher than 800 deg. alloy steels are indicated; twenty or more different designs of boilers are successfully operating at pressures of 500 lb. and over, six at 1,000 lb. and one at 2,000 and over, and enough work has been done to indicate that their efficiencies are comparable to those obtained with boilers of lower pressure.—*Mechanical Engineering,* June, 1928.

*Fuel Handling and Ash Disposal.*—J. R. McCausland.—A discussion of methods and equipment which may be used for the handling of fuel and ash in electric generating stations has been offered, utilizing the practices of one large utility system as a basis. The observations consist largely of experience data obtained at three large tide-water stations utilizing bituminous coal. The author has considered shipping conditions, unloading equipment, a description of the individual plants involved and the facilities available at each, coal storage, prevention of spontaneous combustion and similar factors.—*Mechanical Engineering,* June, 1928.

---

## Generation, Control, Switching and Protection

*Automatic Generating Station in Japan.* — U. Vetsch. — The paper describes a hydraulic generating station located in a mountainous, inaccesible place and designed, for this reason, to be fully automatic. Starting and stopping are accomplished by closing the oil switch at the other end of the transmission line, which ties the automatic station to the distant base plant at Shizumo. One 2,000-kva. vertical shaft, 11,000-volt, 900-r.p.m. generator is installed, driven by a horizontal plane spiral turbine. A relatively small number of auxiliary relays were added to the otherwise standard equipment of the station. Starting and stopping operations are carried on in the same sequence as is customary for manual operation, but the individual steps are mechanically and electrically so interlocked as to prevent the next step unless the previous one has been correctly finished. To avoid the installation and care of a storage battery, the main generator carries on its shaft not only the exciter but also a small auxiliary direct-current generator for the controls. An automatic synchronizer closes the main breaker in the station when potential and phase are correct. Overload, overspeed and temperature relays are provided for the protection of the generator.—*Brown, Boveri Mitteilungen,* May, 1928.

*The Cost of Electrical Switchgear.*—H. Trencham.—It is the contention of the author that the cost, and consequently capital investment, involved in the switching devices used by electric utilities is far too high and he has accordingly offered suggestions toward the reduction of this essential but unproductive item in station design. While a number of specific suggestions involving standardization and minimization of unnecessary items of equipment are offered, a consideration of the technical difficulties involved is recognized.—*Electrical Engineer (Australia),* April 16, 1928.

## Transmission, Substations and Distribution

*Impregnation of Wooden Poles.*—R. Nowotny.—According to the process described by the author a mixture of sodium-fluorate and nitrated phenol is injected into the endangered zone of a wooden pole by means of a special tool which is a combination of hammer and injection syringe. The point of the tool is driven about 1½ in. deep into the wood and a few cubic centimeters of the antiseptic liquid is discharged into the pole. This is repeated at numerous points all around the shaft. Tests made several months after this treatment indicated that the injected chemicals spread out by capillary diffusion a considerable distance up and down from the point of application. A number of European telegraph, telephone and power companies have adopted this impregnation method with good results.—*Elektrotechnik und Maschinenbau,* April 29, 1928.

*Rigorous and Approximate Theories of Electrical Transmission Along Wires.*—John R. Carson.—The elementary theory based upon concepts of transmission phenomena completely determined by the self and mutual impedances of the conductors and the self and mutual capacities, together with the dielectric leakage, are seen by the author as not altogether adequate because of admitted approximation. The first defect is recognized as being a transmission phenomena correctly represented only at some distance from the physical terminals of the system or at some distance from points of discontinuity. It is also stated that when conductors of large cross-sections or the ground form part of the transmission system the elementary theory becomes inadequate. The problems here dealt with have been stated as, first, to investigate the conditions under which the specifications of the system by means of its self and mutual impedances is valid and, secondly, to provide a general method for calculating these circuit parameters from the geometry and electrical constants of the system. — *Reprint B-289 Bell Telephone Laboratories, Inc.*

---

## Units, Measurements and Instruments

*Various Methods of Connecting Indicating Wattmeters.*—John Auchincloss.—A discussion of suitable methods for connecting indicating wattmeters for three-phase, three-wire circuits; three-phase, four-wire circuits; single-phase and polyphase instruments; various combinations of current and potential transformers, and certain power-factor and voltage-balance considerations are offered by the author in a technical evaluation of possible practices. It is stated that since no billing is done with indicating wattmeters, operating companies sometimes sacrifice accuracy for the sake of avoiding added investment in large instrument transformers. This is recognized as a justifiable practice in some cases, but is not recommended without a thorough understanding of the accuracies inherent in such combinations and in their application. — *General Electric Review,* May 1928.

*Totalizing the Output of Two or More A.-C. Circuits.*—The installation and operating requirements that must be satisfied for the totalizing of the output of two or more alternating-current circuits on one watt-hour meter by paralleling the secondaries of current transformers are offered in this report. This method of measurement has been devised to meet certain peculiar conditions existing in various parts of the country. It is stated that it has been considered advisable to make a study of the method and to point out some of the limitations and requirements that must be satisfied in its application. The effect of equally and unequally loaded circuits, current-transformer secondary connections and secondary burden are all discussed in detail. The general problem of the determination of correction factors for a combined installation of this type has been thoroughly covered and the procedures are included for the determination of these factors by actual test and by calculation. Test data substantiate the conclusions determined in this investigation.—*Serial Report National Electric Light Association,* May, 1928.

## *Illumination*

*Four Variables of the Visual Threshold.*—Percy W. Cobb and Frank K. Moss.—At least four variables are recounted by the authors as entering into the description of any visual object. Two of these are recognized as photometric, namely, the brightness of the object and that of its ground. The third is the size of the object expressed in visual angle, and the fourth is the time during which the image of the object acts upon the retina of the eye. The object of the present investigation has been to determine the inter-relations of these factors by a uniform method over wider ranges than has previously been undertaken. The specific objects to be determined were: The brightness, closely approximated by the brightness of the background upon which a dark object is exposed when at its threshold value; the contrast ratio, which is the ratio of the difference between these two, due to the background brightness; the visual angle under which the object is seen, and the exposure time.—*Journal of the Franklin Institute,* June, 1928.

*Daylight, Artificial Light and Artificial Daylight.*—J. S. Dow.—An analysis of the merits and drawbacks of the three types of illumination ordinarily available has been offered in this discussion, in which the results of a comprehensive research investigation have been included. Comparisons and differences between natural and artificial light, the contrast effect of the bright sky, the differences in the visible and ultra-violet spectrum, requirements of different classes of buildings, the transition from natural to artificial light, the relative intensity of illumination needed by natural and artificial light, influence on acuteness of vision, architectural considerations and several psychological effects have been considered in this discussion. — *Journal of Good Lighting (England),* June, 1928.

## *Heat Applications and Material Handling*

*Storage Batteries in Relation to Modern Supply of Electric Lighting and Power.*—E. C. McKinnon.—It is the author's prediction that storage batteries will be in wide demand for innumerable purposes for many years. New applications are foreseen as continually arising and it is stated that no equally reliable stand-by source of electrical energy is at present known. The author reports a definite trend in Great Britain toward the running of the supply station's power auxiliaries from a direct current supply and the installation of storage batteries of adequate capacity to carry the station's power load for a period varying from twenty minutes to one hour. This insures an unfailing supply of power for maintaining the circulating water supply, operating overhead cranes, a proportion of the stoker motors, switch control and the essential pilot lighting. A number of features have been considered in this discussion, including battery room design, battery design, tests, special applications, special methods of charging, the supply of materials for the construction of batteries and a consideration of the future prospects for use by electric light and power companies.—*Journal of the Institute of Electrical Engineers (England),* May, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*The Design and Distribution of Wireless Broadcasting Stations for a National Service.* — P. P. Eckersley. — Great Britain was the first nation to give a single authority the responsibility for the conduct of a national service of broadcasting. This paper deals with some of the aspects of the underlying problems in the distribution and design of broadcasting stations to give a national service. The endeavor to present a comprehensive view of the situation precludes the possibility of a quantitative discussion. Each of the sections of the paper might well be used as a basis for a more detailed discussion, but a general exposition of the subject is offered here. The author suggests that peculiar interest attaches to the science of broadcasting, as the subject comprises not only technical but also psychological problems. No other technical public service depends for its successful operation upon material and operation supplied by relatively unskilled persons under no authority or disciplined direction.—*Journal of the Institution of Electrical Engineers (England),* May, 1928.

## *Miscellaneous*

*Combined Light and Suction-Fan Trap for Insects.*—W. B. Herms and R. W. Burgess.—An insect trap consisting of a 300-watt lamp, a reflector, a small electric fan, a collecting sack and a wind vane, for directional location of a protective windshield, has been utilized with conspicuous success in an insect-infested lake section of California. As a measure of the efficiency of this device it is reported that in two hours of use 11 lb. of gnats were trapped and destroyed. During a season more than 156 lb. of the insects were similarly eliminated. The device is simple, being capable of home-made construction, and may be placed in any location where electricity is available. The energy requirement is low, consisting of the 300-watt lamp and a small electric lamp motor.—*Electrical West,* April 1, 1928.

*Photomicrographic Study of Rough or Nodulized Electrodeposited Nickel.*—C. Upthegrove and Edwin M. Baker. —Nodulized or rough nickel deposits are undesirable in that they cause rejections of plated work, increase the difficulty of buffing and lower the protective value of the plate. A photomicrographic study was made of some excessively nodulized deposits. This study indicated that the nodules are apparently not related to imperfections in the base upon which the plating is done nor to the method of cleaning, as the nodulized growth may start after metal has been deposited to some thickness. In general, it is concluded that the nodules are a result of suspended particles in the bath which may come in contact with the surface of the metal after deposition has started. The indicated remedy, therefore, is the maintenance of more nearly clear solutions.—*Report American Electrochemical Society,* April, 1928.

*Are Electrons Waves?*—C. J. Davisson.—Circumstances have been found, according to the author, in which electrons do not appear as particles at all, but as waves. The results of a number of experiments in which a narrow stream of electrons has been directed against the base of a nickel crystal and the conditions under which a sharply defined stream of electrons leaves the crystal have justified this conclusion. Observations were also made with reflected-electron phenomena in connection with a target of ordinary polycrystalline nickel. Wave lengths and velocities of electrons are developed as a result of several phases of the determinations made. On the other hand, it is not contended that electrons are waves, although they have the characteristics and qualities indicated in this research.—*Journal of the Franklin Institute,* May, 1928.

# News of the Industry

## San Francisco Valuation Figures Miles Apart

*Pacific Gas & Electric and Great Western Companies Value Distribution Systems Plus Severance Damages at $97,000,000, City at $28,200,000*

THE marked difference of opinion long known to exist as to the valuation of the San Francisco electrical distribution systems of the Pacific Gas & Electric Company and the Great Western Power Company between those two companies on the one hand and the City and County of San Francisco on the other hand is clearly brought out in the briefs filed June 15 with the California Railroad Commission. The Pacific Gas & Electric Company sets $67,000,000 as the value of the property which the city is seeking to acquire for the distribution of electrical energy developed by the Hetch Hetchy project. The city's figure is $18,894,005, including severance damages put at $457,360. The Pacific Gas & Electric Company sets its severance damages at $27,000,000. The Great Western Power Company has set $30,000,000 as the valuation of its properties in question, while the city believes that $9,306,537 is an equitable valuation of the same properties.

The figures given relate to the value of the properties on Feb. 11, 1924, the date the city filed its petition to the Railroad Commission "to fix and determine the just compensation to be paid by the City and County of San Francisco." Hearings and surveys have extended over the last four years. The actual hearings have covered a period of approximately three years and numerous witnesses of national standing have testified. Among the most prominent of these are Dr. Arthur T. Hadley, former president of Yale University; Alex Dow, president Detroit Edison Company, through whose testimony to the effect that he would have been willing to organize a syndicate in 1924 and purchase the property involved for $40,000,000 the Pacific Gas & Electric Company established the valuation of its property, and Sidney Z. Mitchell, president Electric Bond & Share Company, New York, whose estimate of the market value of the property on Feb. 11, 1924, has been used as its valuation figure by the Great Western Power Company.

The two companies contend that in arriving at the valuation figures a number of major factors should be taken into consideration, such as reproduction cost new, market value as it would be reflected in the remaining properties after the San Francisco holdings had been withdrawn, added difficulty in obtaining money because of the loss of the best-paying part of the entire system, going-concern value, and revenue loss through loss of urban consumption of energy in winter when there is slack demand for energy in rural districts.

On the other hand, the city holds that the claims presented by the companies are grossly extravagant and exaggerated and that the basic theory of damage to the remainder of the system and business is unsound and cannot be supported by principles of law applicable to eminent domain proceedings.

Regardless of the decision in the present case, another series of hearings must be held to determine the value added to the properties by expenditures since 1924. The expenditures of the Pacific Gas & Electric Company are said to have been between $12,000,000 and $15,000,000 and those of the Great Western company between $7,000,000 and $9,000,000.

## Denver Greets the Institute

### Summer Convention in Colorado's Capital Adds Another to the Technical and Social Successes of the A.I.E.E.—Five Americans Made Honorary Members

DELEGATES from forty states attended the summer convention of the American Institute of Electrical Engineers in Denver on June 24 to 29. More than five hundred engineers listened to excellent technical programs, enjoyed the entertainment and were delighted by Rocky Mountain scenery. On Monday the section and branch delegates discussed their affairs. At the business meeting on Tuesday important announcements were made and formal announcement of the new officers elected was made. The mail ballot resulted, as usual, in indorsement of the official slate as follows:

*President*—Rudolph F. Schuchardt, electrical engineer Commonwealth Edison Company, Chicago.

*Vice-Presidents* — Northeastern District, E. B. Merriam, General Electric Company; New York City District, H. A. Kidder, Interborough Rapid Transit Company, New York; Great Lakes District, W. T. Ryan, University of Minnesota; Southwest District, B. D. Hull, Southwestern Bell Telephone Company, Dallas; Northwest District, G. E. Quinan, Puget Sound Power & Light Company, Seattle.

*Managers*—A. E. Bettis, Kansas City Power & Light Company; J. Allen Johnson, Niagara Falls Power Company; A. M. MacCutcheon, Reliance Electric & Engineering Company, Cleveland.

*Treasurer*—George A. Hamilton, electrical engineer (retired), Elizabeth, N. J.

The board of directors announced the election of five honorary members of the Institute. These are Thomas A. Edison, John J. Carty, Michael I. Pupin, Ambrose Swasey and Elihu Thomson. Their election is in conformity with a new policy, they being the first honorary members who reside in this country.

In his presidential address Bancroft Gherardi talked on the topic "Civilization and the Engineer." He traced the growth of science from the time of Galileo and Newton and showed that power and machinery had enabled mankind to produce more than the primary necessities of life. Through this excess production capital was created, and capital made possible leisure for cultural development. President Gherardi pointed out that culture could be sustained only by widely distributed material prosperity and that the engineer and his works contributed many things to the spiritual progress of the world.

The technical sessions afforded opportunity to hear and discuss notable technical papers. One session was devoted to recent investigations of surges on transmission lines. Several utility companies presented data taken from surge recorders and stated the conclusions arrived at. In general high-voltage surges were found to occur with values ten to twelve times normal because of lightning and four to five times normal because of switching. No definite conclusions could be made from the data as to the effective work of ground wires, nor were the data sufficiently accurate and numerous to determine the wave fronts, types of waves and other quantitative results. More experimentation was announced as an industry program.

Another feature session dealt with the use of high-speed circuit breakers in railroad electrification. Several papers described design characteristics of breakers of the latch and magnetic holding types and discussed the details of these breakers as applied in railway service. In general the object is to interrupt a fault as quickly as possible in order to minimize inductive effects and damage to apparatus. An active discussion occurred as to the relative merits of oil and air breakers and as to the relay arrangements used to get selective breaker operation.

The technical committee chairmen presented reports of work done during the year and gave a résumé of the status of the art in their respective fields of activity. Notable progress was evidenced in many lines of research and development. The use of structural-steel welded materials is increasing rapidly. Many improvements have been made in transformers and in other machinery. In lighting there has been a refinement in design and an extension of application because of the trend toward decorative illumination. In electrochemistry and electrometallurgy many new applications were recorded.

The use of graphite in dry cells, commercial growth of electrolytic zinc plants, chromium-plated materials and new devices in heat-treating of materials were some of the topics brought up. Standardization has been used in several types of equipment and much will be presented next week.

At other technical meetings a wide variety of topics were presented and discussed, including welding, elevators, carrier current, arcs and transmission-line design. All the technical sessions were well attended. A complete report will be presented.

The whole convention enjoyed an all-day trip through Denver's parks and among the snowclad mountains. A dinner-dance was given on Wednesday evening and a theater party was scheduled for the outdoor theater on Thursday. With good weather, a delightful environment and admirable local committee arrangements, the summer meeting at Denver scores a notable success.

## Tennessee and Arkansas Bureaus Investigated

*Federal Trade Commission Still Concerned with Utterances of State Information Committee Directors—Kansas Also Heard From*

MORE letters from J. B. Sheridan, director of the Missouri Committee on Public Utility Information, were placed in evidence when he again went on the stand at Washington on Thursday, June 21, in the investigation into the public utilities which the Federal Trade Commission is making. These dealt, among other things, with the Associated Press and its attitude toward the committee's publicity matter, which Mr. Sheridan at one time thought unfavorable, but which subsequently, he thought, changed; with the expressed approval of Governor Sam Baker when he was Superintendent of Public Schools in Missouri of a plan to distribute public utility pamphlets in the schools, followed by a refusal to give the proposal formal indorsement, and with the political agitation against the utilities promoted by what Mr. Sheridan called the "Walsh-Norris-Pinchot-La Follette crowd."

The witness in letters to Thorne Browne of the Middle West Division of the National Electric Light Association said that he was convinced that the public utility industry should "clean house" and rid itself of companies which did not play the game squarely, recommending publicity as the means of carrying out the idea.

Guy P. Newbern, director of the Tennessee Public Utility Information Bureau, testifying the next day, asserted that his bureau had distributed considerable printed matter opposing the Muscle Shoals project. Letters introduced at the hearing indicated that a close watch was maintained on newspaper editorials and articles on this subject. In a report to his executive committee, Mr. Newbern described how at a meeting of public utility men in Washington in April, 1926, "plans were made for a big educational campaign on the Muscle Shoals bids of the associated power companies." Mr. Newbern testified that pamphlet supplied to the bureau by the National Electric Light Association were distributed in large numbers to Tennessee schools, newspapers, libraries and public officials. Ten thousand sets of three pamphlets each were placed in schools last year, one of the exhibits showed. Mr. Newbern said that his bureau collected and disbursed $18,000 in 1927. There had been no survey of textbooks in Tennessee.

Details of the utilities' fight in behalf of the state utility commission in Tennessee were revealed in a speech by Ross Murphy, former director of the bureau, placed in the record during examination of Mr. Newbern. Reviewing a controversy over that commission, Murphy told utility men "only the concerted efforts of every public utility in the state" saved the commission in the Senate after the House had passed a repeal bill, the bill being set aside by a vote of 18 to 11.

On Tuesday, June 26, Earle W. Hodges, now connected with Henry L. Doherty, New York, but formerly director of the Arkansas Public Service Information Bureau, was a witness. A transcript of a speech alleged to have been made by him in 1923 at an N.E.L.A. meeting in New York was shown to him. In this transcript Mr. Hodges was quoted as saying: "If we do have any propaganda (and I don't like that word at all, for it is one of the Kaiser's favorites), we so conceal or 'sugarcoat' that propaganda with boosting that it is generously entered into and got back of by all of the chambers of commerce, civic clubs, men's and women's organizations over the state." Mr. Hodges could not remember using these words.

Rex I. Brown of Little Rock, secretary-treasurer of both the Information Bureau and the Arkansas Utilities Association, refused to admit that the *Dixie Magazine,* devoted to stimulating interest in the state's resources, had been subsidized. In the course of two and a half years, he said, $8,719 had been paid the magazine for subscriptions and advertisements and as loans. In no instance had he requested the publication of any article in the magazine.

Further questions brought from Mr. Brown the statement that no textbook survey had been undertaken in Arkansas, as far as he knew, and no effort had been made to check up on the amount of utility news printed in the Arkansas newspapers.

Observers in attendance at the hearings on Wednesday were impressed with the clear, straightforward testimony of H. Lee Jones, the director of the Kansas bureau. He had a ready and positive answer to each question, and it was apparent that he was proud of the work his bureau had done and had no doubt as to the soundness of the doctrines he has preached and the wisdom of the methods used to further them. Mr. Jones insisted that no advertising was placed with any newspaper with any thought or desire to influence its editorial policy. The support of any editor who could be influenced by advertising, he declared, would not be worth having. His committee acted on that assumption and placed its advertising on a strictly commercial basis.

Mr. Jones told of the co-operation of Kansas utilities with the state authorities, state educational institutions and agricultural organizations in efforts to speed the extension of electric service to the farms. He stated that 13,000 copies of a pamphlet setting forth fundamental facts on the utility industries had been distributed to schools and that an advertisement had been carried in one issue of the *Kansas Teacher* in which it was represented that the booklet would be of value in connection with courses in physics and civics. There was no concealment of the source of the material. Those interested were asked to apply to the Information Bureau of Kansas Public Service Companies.

Indiana men were under subpœna for Thursday's session.

## Wisconsin Accountants Stage Meeting of Wide Scope

Three addresses of general interest to all utility men as well as to the public were made at the annual two-day convention of the Accounting Section of the Wisconsin Utilities Association in Milwaukee, June 21-22. The interest they aroused was undoubtedly responsible for attracting the largest attendance ever recorded by this section. A total of 96 accountants were registered, as against 56 last year, and at one of the sessions more than 150 utility men were in the audience.

Lewis E. Gettle, chairman of the Railroad Commission of Wisconsin, denounced in scathing terms the Hearst newspaper propaganda and the attempts that have been made to misrepresent his own attitude in opposing the Walsh resolution. Mr. Gettle represented the Wisconsin association as chairman at the Washington hearings and was accused of being "dragged there by the power interests." His address was a reasoned defense of state versus federal regulation.

Paul M. Binzel, Milwaukee, manager of the buying department of Morris Fox & Company, investment bankers, stressed earning power and minimized equities as a proper basis for the issuance of utility as well as industrial securities. He also argued against the use of reproduction cost as a basis for rates or security issues.

Karl F. McMurry, certified public accountant, Madison, presented records from reports filed with state government departments showing comparisons on rates and population served between privately owned and municipally owned electric systems in Wisconsin. These records, he said, prove that the most economical electric service is furnished by the large privately owned companies.

Two accounting papers that provoked discussion were presented by A. A. Meisenheimer, general storekeeper of the Milwaukee Electric Railway & Light Company, and S. A. Bialecki, credit manager of the Milwaukee Gas Light Company. Mr. Meisenheimer explained in detail the adaptation of tabulating machines to the 57 classes of stores accounts of the company. Mr. Bialecki described methods used to keep losses on bills for service and merchandising down to one-tenth of 1 per cent.

Louis T. Smith, assistant secretary of the Milwaukee Gas Light Company, was elected chairman of the section. A. J. Bohl, assistant secretary-treasurer Milwaukee Electric Railway & Light Company, was elected vice-chairman.

## Purchases and Mergers

The New England Power Association has acquired the controlling interest in the Quincy (Mass.) Electric Light & Power Company, which serves 19,000 customers in the metropolitan district adjoining Boston. The company had gross earnings of $857,000 in 1927.

On Tuesday the Consolidated Gas, Electric Light & Power Company obtained from the Maryland Public Service Commission the right to acquire the entire property and assets of the Northern Maryland Power Company at a cost of $590,875 in cash and, in addition, either a part or all of a deferred obligation amounting to $230,400. This ends the fight recorded from time to time in these columns between the Baltimore and the Philadelphia light and power interests to absorb the Havre de Grace utility. The Baltimore company, when it gets control, will have the right to operate in every part of Harford County except one election district.

Holders of more than a majority of the stock of the Harrisburg Light & Power Company voted this week to sell their interests to the Pennsylvania Power & Light Company in accordance with the proposal already noted.

Sale of the Georgetown (Ky.) Water, Gas & Electric Company, owned by Mrs. R. W. Nelson, to the International Utilities Corporation, holding company of the Lexington Utilities Company, is announced.

Sale of the municipal electric system of Summerfield, Kan., to the Iowa-Nebraska Power Company is announced. Summerfield has been buying its energy wholesale from the municipal plant at Pawnee City, Neb. A transmission line is under way.

Custer City, Okla., has voted to sell its municipal light and power plant to the Southwestern Light & Power Company.

Norfolk, Ark., has sold its lighting plant to the Arkansas Power & Light Company. The new owner has acquired a controlling interest also in plants at four other towns in the northern part of the state—Cotter, Mountain Home, Gassville and Flippin.

The Georgia Power & Light Company has purchased the electric light plant at Pearson and will build a transmission line from Cogdell to that place.

The Gulf States Utilities Company, Lake Charles, La., has offered $125,000 for the lighting, waterworks and ice plants of Vinton, La. The voters are to decide.

The Gulf Utilities Company, New Port Richey, Fla., has acquired the Cedar Keys (Fla.) Light & Power Company, Cedar Keys, Fla. The Florida Public Service Company, Orlando, Fla., is arranging to buy the Mount Dora municipal power plant.

# McGraw-Hill and Shaw Company Merge

### Consolidation Affects Large Number of Engineering and Industrial Papers—Shaw and McGraw-Shaw Companies Become Divisions of McGraw-Hill

A CONSOLIDATION affecting two large publishing interests has just been brought about by the merger of the McGraw-Hill Publishing Company, Inc., of New York and the A. W. Shaw Company of Chicago.

The Shaw organization publishes the *Magazine of Business, System* and the *Industrial Distributor and Salesman*, while the McGraw-Hill organization is the publisher, either directly or through subsidiary and affiliated companies, of more than twenty leading business papers, including the ELECTRICAL WORLD, and of engineering and business books. The two companies have had a close relationship since last fall, when they jointly formed the McGraw-Shaw Company, which publishes *Factory and Industrial Management* and *Industrial Engineering*.

A. W. Shaw will continue as chairman of the board and James H. McGraw will become president of the A. W. Shaw Company. Mr. Shaw will also become a director of the McGraw-Hill Publishing Company, Inc., and will continue as president of the McGraw-Shaw Company. Wheeler Sammons will become a director and member of the executive committee of the McGraw-Hill Publishing Company and senior vice-president and general manager of the A. W. Shaw division of the business, which will be known as the "A. W. Shaw Company, a division of the McGraw-Hill Publishing Company, Inc." The McGraw-Shaw Company will also be operated as a division of the McGraw-Hill Publishing Company.

Two reasons for the merger are stressed by the officers of the merging companies. The magazines of the two organizations are complementary in character. The Shaw papers cover business broadly, giving the business man an understanding of what is going on in all branches of trade, industry and finance. Their service is extensive in character. The McGraw-Hill service, on the other hand, is intensive. Its magazines give a highly specialized service to given major industries and to related industrial groups. Thus the consolidated companies serve the business man in both his general and special business interests. The second reason is the very evident economy and increased effectiveness of consolidated operation, enabling a superior service to be rendered to the whole sweep of American business. Mr. McGraw said:

"Mr. Shaw's organization and ours have been working closely together for more than a year and have seen the benefits of consolidated effort between groups having widely different publishing experiences. The Shaw company has had a signal success in publishing magazines of large circulation and of broad appeal to the industrial and business worlds. The McGraw-Hill company has intensively served by specialized publications the leading engineering industries and the trade channels for distributing their products.

"It was apparent that the McGraw-Hill group of industrial and trade papers would have a new way of carrying the message of common business problems if it was allied with papers like the *Magazine of Business* and *System*. At the same time these publications would be immeasurably strengthened by being tied in with and assisted by the great editorial staff of over one hundred and thirty industrial and business specialists who edit the McGraw-Hill papers. There were also conspicuous opportunities for more effective subscription and advertising work and for economies in every phase of publishing. The logic of these opportunities could not be escaped. The merger has been the result.

"Though every paper of the merging companies will be strengthened by the consolidation, and thus render greater service to its readers and advertisers, the most conspicuous result will be the new and strong position of the *Magazine of Business*. Through Mr. Shaw's vision and courage it is a magazine of strength, standing and influence. It now becomes the capstone of the virile group of papers and the other publishing activities of the McGraw-Hill company, thus extending the scope of the latter organization to the whole range of American business. At the same time, drawing on the intimate contact with trade and industry of the large corps of McGraw-Hill specialist editors, it will speak with unexampled authority on the problems of business. It will be able to render an outstanding service to the business men of America by its authoritative information, its expert interpretation and its fearless advocacy of sound business policies. It will fight for the interests of business, but it will place in an equally important position the responsibility of business to the public. It will, in a word, stand for true business statesmanship."

Mr. Shaw expressed his gratification over the merger in a similar vein.

# Northwest Men for Proclaiming Facts

## Portland Convention Indorses Principles of National Committee on Public Policy—All Sections of Geographic Association Hold Excellent Sessions

DETERMINATION to continue to disseminate facts about the electrical industry as widely as possible was repeatedly expressed at the twenty-first annual convention of the Northwest Electric Light and Power Association, held at Portland, Ore., June 19-22. Urged at the opening session by the president of the association, A. C. McMicken, and two of the principal speakers—Franklin T. Griffith, president Portland Electric Power Company, and Preston S. Arkwright, president-elect of the N.E.L.A.—this determination was voiced in a resolution passed at the executive session "vigorously indorsing" the principles laid down by the public policy committee of the national association at Atlantic City answering propaganda charges.

Making a plea for a continuation of state regulation as opposed to federal regulation of electric utility companies, J. M. Thompson, member of the Public Utilities Commission of Idaho, attacked the theory that in crossing state lines electrical energy becomes a commodity in interstate commerce and therefore escapes the jurisdiction of any state commission. He showed that such energy, before it can serve any useful purpose in the state importing it, becomes commingled with all the other electrical energy generated in that state and takes on a purely local character, which brings it under the jurisdiction of the commission of the importing state. Prior to leaving the exporting state it falls under the jurisdiction of that state's regulatory body in that the property used in such export should be deducted from the property used by the exporting company for purely local distribution in determining that company's rate base in the exporting state. Therefore there is no energy that is not at all times within the jurisdiction of some state commission.

At the session devoted to the Commercial Section C. E. Greenwood, commercial director N.E.L.A., discussed the results of the recent industry sales conferences, through which, as already explained in the ELECTRICAL WORLD, a decision has been reached to study the possibility of a national advertising campaign. Eloise Davison, home economics adviser, N.E.L.A., told of the work of her department.

Reviewing accomplishments in the field of farm electrification and looking forward to greater things, J. T. Jardine, chairman of the Oregon committee on the relation of electricity to agriculture, pointed to agriculture's trend toward industrialization as involving "joint responsibility and joint interest" on the part of all concerned.

In the engineering sessions J. B. Fisken, Washington Water Power Company, Spokane, outlined the history of accident prevention work in industry, called attention to the lack of progress in this work in the electrical industry, outlined a safety program, analyzed accident costs, and closed with a plea that the industry give more attention to the subject.

Discussing phases of electrical development in Great Britain, L. A. McArthur, Pacific Power & Light Company, Portland, stated it as his opinion that the trend in that country was away from government operation and toward private operation.

For the Accounting Section, Chairman F. W. Brownell, Puget Sound Power & Light Company, Seattle, outlined a plan for broadening the scope of the section to include studies of a research nature both within and without the industry, not of a strictly accounting nature, but coming within the scope of the duties of the accounting executive. A study of taxation conditions in the territory during the past year had proved very valuable and would be amplified during the coming year.

Two trends respecting the absorption of securities of electric power companies have raised the point that greater care might be given to the form in which financial statements are published, according to Carl S. Dakan, University of Washington—first, the placing of utility bonds on the legal list for savings banks; second, customer ownership. Mr. Dakan had many suggestions looking toward standardization of terminology and method of presentation of financial reports with a view to eventually forcing the buyer to assume his fair share of the investment risk.

The effort of the Public Relations Section for the year had been devoted to interesting the rank and file of company organizations in informing itself about industry and company problems, and the convention program of the section was largely devoted to displaying the results of that work. Two public-speaking contests and three essay contests had been conducted within the member companies by committees of the section, and the winners of these contests presented their winning papers or talks before the convention.

Officers elected were: President, R. M. Boykin, Puget Sound Power & Light Company, Seattle; vice-president, L. M. Hibbard, Idaho Power Company, Boise; state vice-presidents: for Idaho, R. B. King, Idaho Power Company, Boise; for Oregon, George L. Myers, Pacific Power & Light Company, Portland; for Montana, W. B. McDonald, Mountain States Power Company, Kalispell; for Utah, P. M. Parry, Utah Power & Light Company, Salt Lake City; for Washington, N. W. Brockett, Puget Sound Power & Light Company, Seattle; treasurer, W. E. Best, Puget Sound Power & Light Company, Seattle; secretary, Berkeley Snow, *Electrical West*, Portland.

Registration was about 350, and a crowd of well over 500, the largest ever recorded at a session of this division's convention, heard the public relations program on the last day of the convention. Excellent entertainment was provided.

# Canadian Convention a Big Social Success

## *Committee Reports and Formal Proceedings Play Subordinate Part in Four-Day Steamboat Trip Affording Profit Through Personal Intercourse*

MANY of the 275 delegates on the four-day boat convention of the Canadian Electrical Association last week pronounced it the most successful which they had ever attended. The president of the association, J. B. Woodyatt, in his opening remarks, expressed the motive which guided the preparation and execution of the program. He declared that the chief value of a convention is the opportunity which it affords for men with related interests from widely separated territories to get acquainted with one another and compare problems and experiences. He emphasized the social value, saying that committee meetings throughout the year can accomplish better business results than discussions on the floor of a convention. Only three half days were allotted to committee reports, and they were presented with great dispatch, a few remarks on the outstanding accomplishments of the past year being concluded by reference to the printed reports for details.

The SS. *St. Lawrence*, on which the convention was held, made the trip from Montreal via the St. Lawrence and Saguenay Rivers to Port Alfred and return, allowing a full day's stop-over at Port Alfred for a 125-mile motor trip to the Aluminum Company's plant at Arvida, the Price Brothers paper mill at Riverbend and the Duke-Price hydroelectric plant at Ile Maligne. A stop-over at Murray Bay was made for sports and the banquet.

Aside from the pronounced social character of the convention, it was notable in that executives of the utility regulating commissions were invited to attend for the express purpose of seeing that "utility men are not so diabolical as they are pictured," as Mr. Woodyatt phrased it. Four members of the Quebec Public Service Commission, a member of the Electrical Commission of Montreal and a member of the Ottawa Board of Railway Commissioners attended. The Canadian Engineering Standards Association and Electrical Standards Laboratory were also represented.

R. J. Wensley demonstrated "Televox," the "electrical man," and R. Treat presented a paper on methods of providing the most reliable transmission service.

P. S. Gregory, assistant to the vice-president of the Shawinigan Water & Power Company, was elected president for the coming year. H. M. Lyster continues as secretary of the association.

## Neff and Holloway Address Agricultural Engineers

Assurances that the utility companies will do whatever is necessary to extend 24-hour electric service to the farms of the country just as they have extended it to all villages and hamlets were given the American Society of Agricultural Engineers by G. C. Neff, general manager of the Wisconsin Power & Light Company, who addressed that body at Washington on June 21. He declared that five hundred thousand farmers now are receiving 24-hour service.

E. A. Holloway, sales engineer Iowa Railway & Light Corporation, presented for reference a summary of a number of representative line-extension policies and rural rate schedules from which future policies may be more intelligently planned. The paper contained the complete rate schedule and rules for the extension of rural lines used by eight companies in as many states, arranged so that all can apply each schedule to a specific rural extension with accuracy. Three specific rural lines, one with three, one with four and one with five consumers per mile of line, were used for the application of each rate schedule.

R. W. Trullinger, assistant in experiment station administration, Department of Agriculture, read a paper on "Research in Rural Electrification, 1927," in which he came to the conclusion "that it is not always entirely sound to assume the perfection and economy of any particular kind of power and its corresponding equipment and to modify agricultural practices to permit the use of such power and equipment. The tendency, on the other hand, appears to be to determine the requirements of individual practices for power, and, with this as a basis, to lay down the specifications for power equipment which will best meet these requirements."

## Want Large Delegation for Tokyo Congress

A nation-wide movement to marshal a large delegation of engineers from the United States to attend the first World Congress of Engineers, which will be held in Tokyo next year, is now under way. Maurice Holland, executive director of the American committee, reports that engineers and engineering societies in the United States will be organized into units to promote interest in the congress. As before announced, Dr. Elmer A. Sperry is chairman of the American committee and Herbert Hoover is honorary chairman.

A special committee on promotion and attendance has appointed Ernest Hartford of New York as its secretary. Mr. Hartford was authorized to organize local co-operative committees throughout the United States which would include the local sections of the founder engineering societies as well as independent local engineering clubs and societies. Through these groups it is expected that prominent engineers from many cities in the United States will be led to attend and participate in the congress. William E. Wickenden was authorized to communicate with the presidents of engineering colleges requesting their indorsement of and active aid in a plan to raise by subscription among the alumni a testimonial fund to send delegates to the congress. The delegates are to be designated by the proper officials of the colleges and to be members of their faculties.

The members of the committee on promotion and attendance are George W. Fuller, chairman; Edward Dean Adams, J. J. Carty, Howard E. Coffin, Gano Dunn, Bancroft Gherardi, John Hays Hammond, Charles H. Herty, Samuel Insull, Arthur D. Little, William Benson Mayo, Charles D. Marx, William C. Potter, E. Wilbur Rice, Jr., Charles M. Schwab, George Otis Smith, John F. Stevens, S. W. Stratton, Ambrose Swasey, Samuel M. Vauclain, H. H. Westinghouse and William E. Wickenden.

## A.S.T.M. Annual Meeting at Atlantic City

Atlantic City was the scene this week of the thirty-first annual meeting of the American Society for Testing Materials. The president's opening remarks were made by Prof. H. F. Moore of the University of Illinois on Tuesday afternoon. Committee reports were, as usual, very copious. A summary of a few items of especial interest to electrical technicians and specialists is as follows:

The committee on magnetic properties (Thomas Spooner, chairman) submitted a proposed standardization of magnetic terms, units and symbols and recommended the advancement to standard of revised methods of test for magnetic properties of iron and steel at low inductions.

The committee on magnetic analysis (R. L. Sanford chairman) discussed the nature and present status of magnetic analysis and the relation of the committee to its development and pointed out the need for a larger number of investigators and a greater degree of co-operation in this field of non-destructive testing.

The incremental permeability method for the magnetic analysis of high-speed steel was discussed by W. B. Kouwenhoven and Julian D. Tebo, who presented results of tests on high-speed steel bars using a method based on incremental permeability in which a given magnetizing force is applied to the bar in question and the change in flux produced by an increment of magnetizing force is measured.

Endurance of high-speed cut-off tools in relation to magnetic and other measurements was the topic of Haakon Styri, who presented results of magnetic, electric, Rockwell hardness and duroscope readings on a number of standard cut-off tools hardened from different temperatures and used in cutting off rings of high-carbon chromium steel of about 200 Brinell hardness.

The committee on electrical insulating materials (H. S. Vassar, chairman) submitted, as tentative, methods of testing varnished-cloth tape, additional tests for laminated materials covering compressive strength and water absorption, and a complete revision of the tentative methods of testing molded insulating materials for resistance to impact, broadening the scope

## Toledo Edison Pursues Its School Work Undismayed

THIS year's graduating class of the Notre Dame Academy, a school for girls at Toledo, Ohio, recently visited the Acme generating plant of the Toledo Edison Company and after a tour of inspection commandeered one of the electric locomotives for a ride about the coal-storage yards and switch tracks. As a result several girls expressed a determination to pursue the study of electricity through their college courses. Since the first of January the Toledo Edison Company has provided for this and other schools in its territory a series of talks and practical demonstrations dealing with the manufacture and distribution of electrical energy. Many letters of appreciation have been received by C. L. Proctor, vice-president and general manager, from the teachers and school boards of schools visited. Mr. Proctor will extend this educational service over a wider field, and plans have been perfected whereby upward of thirty thousand high-school and college students will hear these talks by Jan. 1.

to include ceramic and laminated materials. This committee recommended modification in methods of testing molded insulating materials, calling for a new form of tension-test specimen.

## Camp Co-operation VIII Arranges Program

As already published, the seventh electrical league conference—Camp Co-operation VIII—held under the auspices of the League Council and sponsored by the Society for Electrical Development, will take place at Association Island, Henderson Harbor, N. Y., Aug. 2 to 7, inclusive. The many acceptances already received point to a well-attended meeting. In the business program, prepared under the direction of the League Council, headed by J. E. North, two main subjects have been kept in mind —(1) to report on plans, experiences, developments and results of league activities carried on during the past twelve months; (2) to give the league representatives a picture of changes in national thinking and working both inside and outside the industry. The wiring, lighting, appliance and industrial phases of league work will all be treated.

The conference will open Thursday afternoon, Aug. 2, with flag-raising exercises and an address by C. L. Collens. In the evening F. W. Freeman, president Society for Electrical Development, will speak; J. E. North will report for the League Council, and W. E. Sprackling for the Electrical Industry Sales Conference.

On Friday morning, when promotion of wiring business will be the theme, "The Place of the 'Red Seal' in the Program to Adequately Wire the Homes of America" will be discussed by S. A. Dennis, and "The Status of 'Red Seal' Today" by B. Badrian. Conspicuous examples of "red seal" accomplishment will be given by C. C. Monroe of Detroit, E. W. Hane of Chattanooga, E. J. Beil of Youngstown and a representative of the California Electrical Bureau. On Friday evening Mr. North will tell about "The Plan for Further Broadening the Electrical Market," and other topics will be adequately presented. The promotion of lighting business will be the topic for Saturday. In the evening "The Buying Habits of the Electricity-Using Public" will be examined by Dr. Paul T. Cherington and "The Future of Associations as a Useful Instrument" will be discussed by Hugh P. Baker, manager trade association department, United States Chamber of Commerce.

Sunday will be given over to rest and recreation with an address after supper by a speaker of national prominence. Monday the promotion of appliance business will be on the carpet. "Intertrade Merchandising Problems" will be looked into by C. E. Greenwood, commercial director N.E.L.A. There will be an open forum for the discussion of league problems in the evening. Promotion of industrial business will take up Tuesday morning, Aug. 7.

## Briefer News

Interstate Line from Shreveport to Marshall Begun.—Construction of a 66,000-volt transmission line from Shreveport, La., to Marshall, Tex., about 25 miles, by way of Trees City, La., and Jefferson, Tex., is starting. The line will be erected for the Southwestern Gas & Electric Company, which supplies power for most of the towns and cities in that area.

McGraw-Hill Publishing Company Announces "Food Industries."—The McGraw-Hill Publishing Company announces that, starting in October, it will publish a monthly to be known as *Food Industries.* The new publication will be for men interested in the manufacturing and processing of foods. Its editorial direction will be under Dr. H. C. Parmelee, editor of *Chemical and Metallurgical Engineering.*

Boston League Has Service Connection Committee.—A service connection committee of executive officers has been formed by the Metropolitan Electrical League of Boston for a discussion of the advantages of uniformity of thought about central-station service requirements. A sub-committee will analyze service requirements of the Boston, Cambridge and Malden central-station companies. When this analysis shall have been completed the companies will, it is thought, be in a position to co-ordinate their requirements by agreement between themselves and in line with suggestions from other groups. The action taken is almost sure to attract interested consideration throughout New England central-station circles.

## *Coming Meetings*

**[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]**

Michigan Section, N.E.L.A.—Mackinac Island, July 5-7. Herbert Silvester, Edison Bldg., Ann Arbor, Mich.

Public Utilities Advertising Association—Detroit, July 8-12. T. P. Pfeiffer, Byllesby Engineering & Management Corp., Chicago.

East Central Division, N.E.L.A.—Cedar Point, Ohio, July 10-13. D. L. Gaskill, Greenville, Ohio.

National Electric Credit Association—Boston, July 16 and 17. F. P. Vose, 1008 Marquette Bldg., Chicago.

Wisconsin Utilities Association, Electric Section—Appleton, Wis., July 26 and 27. J. N. Cadby, 432 Broadway, Milwaukee.

National Electrical Manufacturers' Association — Policies Division, Association Island, Henderson Harbor, N. Y., July 29-Aug. 1. S. N. Clarkson, 420 Lexington Avenue, New York.

Camp Co-operation VIII—Association Island, Henderson Harbor, N. Y., Aug. 2-7. Society for Electrical Development, 420 Lexington Avenue, New York.

Association of Electragists International—Hotel Stevens, Chicago, Aug. 6-11. L. W. Davis, 15 West 37th St., New York.

American Institute of Electrical Engineers — Pacific Coast convention, Spokane, Wash., Aug. 28-31. F. L. Hutchinson, 33 West 39th St., New York.

Wisconsin Legislature Committee Inspects Ontario Hydro.—A special committee appointed by the Wisconsin Legislature has been touring the Province of Ontario making a detailed inspection of hydro-electric service in representative rural communities and in towns and cities, with a view of making recommendations for further utilization of Wisconsin's water-power resources. The party is under the direction of John Purcell, who is in charge of rural extension work in Wisconsin.

Illumination Problems Studied by Special Class at Nela Park.—The course on problems of modern illumination given from June 11 to 16 by the Nela School of Lighting of the National Lamp Works in Cleveland was well attended. Thirty-seven members were registered, several from across the seas, and the remainder consisting of central-station men, college instructors and men closely associated with the business of lighting. Takeshi Hirohashi of Tokyo, Japan, received honorable mention in the final examinations.

Seattle to House City Lighting Department in New Substation.—The Seattle City Council has appropriated $991,500 to cover the cost of a substation and lighting department office building and equipment. Tentative plans provide for a structure with two stories and two basements at Third Avenue and Madison Street. This building will cost $200,000, the site the same amount, and the remainder will be spent in equipment.

Crossing the Red River from Texas to Oklahoma.—The recently energized 66,000-volt transmission line which links the West Texas Utilities Company's system at Vernon, Tex., with that of the Southwestern Light & Power Company at Frederick, Okla., crosses the Red River by means of a span which is 2,223 ft. in length between rest frames and 3,316 ft. between dead ends. It is carried on steel towers high over the stream that here forms the interstate boundary.

Bill Introduced to Permit New Orleans to Buy Public Service Properties.—Measures have been reported favorably to the Louisiana Senate which prescribe methods of finance that will enable the city of New Orleans to exercise its legal authority to purchase properties of the New Orleans Public Service, Inc. The bills authorize the city, after approval by a vote of the people of New Orleans, to issue 50-year bonds, to be secured by the properties purchased and the income derived from them. The city government also is empowered to sell or lease the properties to third parties. These bills, it was explained, are for the purpose of permitting the city to distribute natural gas in New Orleans in the event other arrangements are not made. The New Orleans Public Service, Inc., owns also the light and power system of city.

Detroit's New "White Way."—Detroit is getting ready to boast one of the most brilliantly lighted thoroughfares in the world after July 10, when current will be sent into the "whiteway" system on Washington Boulevard. Plans for the event include the attendance of city officials, members of the International Advertising Association, which will be in convention there, and men prominent in the city's business life.

Power Plant Stack to Guide Aviators.—A move to co-operate with the government in directing aviators at night is reported from Colorado. The smokestack of the Pueblo plant of the Southern Colorado Power Company is 250 ft. high and 14 ft. in diameter at the base. The stack is to be lighted by eight 500-watt floodlamps placed in pairs at the base of the stack. When lighted they will cause the stack to appear as a huge illuminated cylinder.

Pacific Gas & Electric Will Supply Energy to 43 Airway Beacons.—Contract to supply electrical energy for the lighting of 43 airway beacons in California has been awarded to the Pacific Gas & Electric Company by the United States government. The contract includes 85 miles of the San Francisco-Los Angeles route, 185 miles of the San Francisco-Seattle route and 135 miles of the San Francisco-Salt Lake route, or a total of more than 400 miles. The beacons will be approximately 10 miles apart.

Brooklyn Edison Company's Prohibition of Submetering Challenged.—Steps which were taken by the Brooklyn Edison Company to prevent the spread of the practice of electric submetering from Manhattan Borough, where it is widespread, to Brooklyn, where it had obtained a relatively small foothold, by means of an amendment to the company's rules filed with the New York Public Service Commission, have been challenged by the Survel Realty Corporation, owner of a large new apartment building, and a hearing on the company's rule, which has been in operation since Feb. 5 and which probibits service through a master meter for submetering, will be held.

Dix River Plant Breaks Record.—All generating records of the Kentucky Hydro-Electric Company, operating the Dix River plant, were broken on June 13, when over a twenty-four-hour period the plant produced 512,000 kw.-hr., operating steadily at 94.9 per cent of generating capacity. A still higher record could probably have been made if there had been an outlet for additional energy. On June 12 the output was 486,000 kw.-hr. The previous record had been made on Jan. 1, 1927, and was 453,000 kw.-hr. Heavy rains made the new figures possible, there being 244.7 ft. of water behind the dam and 2.7 ft. of water breaking over the spillway. The company says the output recorded is in excess of the anticipated capacity of the plant.

Columbus' New "White Way."—"White way" boulevard lights are being installed in the driving park on Livingston Avenue, Columbus, Ohio. Approximately 17,000 ft. of cable and 64 light standards will be used to light Kelton, Lilley, Berkeley and Geers Avenues in the park, according to the superintendent of the municipal light plant. The new lamps are of the lantern type, 13 ft. above the street, with 400-cp. bulbs. The are spaced 200 ft. apart on alternate sides of the streets.

"Televox" a Popular Man at Electrical Conventions.—At a number of recent electrical conventions a popular attendant has been "Televox," the electrical man built by R. J. Wensley of the Westinghouse Electric & Manufacturing Company to demonstrate his televocal system for the automatic operation of machinery by sound. This system was described in the Electrical World, for Oct. 15, 1927 (page 803). The picture shows W. L. Frost, general commercial manager Southern California Edison Company and retiring president Pacific Coast Electrical Association, giving orders to "Televox" at the recent Pasadena convention of that association.

Dedication of Norwood Plant in North Carolina. — Seven hundred people, representing 191 communities, attended a barbecue given by the Carolina Power & Light Company near Mount Gilead to mark the opening of the Norwood hydro-electric power plant. This new station, situated on the Pee Dee River in Montgomery County, about four miles from Mount Gilead, has a concrete spillway dam 1,553 ft. long combined with an earth dam 1,258 ft. long with a maximum height of 100 ft. The reservoir is 18 miles long with a maximum width of three-fourths of a mile and covers 6,500 acres. The power house is built into the downstream face of the dam on the east side of the river. The generating equipment consists of one 24,000-hp. and two 29,000-hp. vertical generators, directly connected to waterwheels, making the total capacity of the plant approximately 82,000-hp. Provision has been made for the installation of a fourth unit. The generators are outside the power house and are protected by steel covers. The operating head on the wheel is 72 ft.

Springfield, Mass., and Turners Falls Company Sign Contract.—The Springfield (Mass.) Water Commission and the Turners Falls Power & Electric Company have signed the contract by which the company is to purchase from the city electrical energy generated in a plant to be built in connection with the Cobble Mountain reservoir and dam. The next move is to obtain the approval of the Massachusetts Public Utilities Commission, which is asked to set an early date for a hearing. The company is to take a 30-year lease of the plant, with payments of $270,000 annually, and turn the plant back to the city in a satisfactory condition at the expiration of that term.

Experiment in Parallel Operation Between Keokuk and Boston.—The area of previous experiments in long-distance parallel operation was extended recently during a four-hour test of the Joliet-Kewanee line of the Illinois Power & Light Corporation. When the test began power from Keokuk to Kewanee was cut at Galesburg and Chicago station power was cut into the Kewanee loop. Immediately thereafter Keokuk was cut into the Chicago wire, St. Louis was added to the circuit, and then parallel operation all the way to Boston was effected through Chicago. It was reported to be the first time that direct connection had been established between Chicago and St. Louis.

"World's Largest" Cooling Tower for Birmingham, England.—A reinforced-concrete cooling tower which is now being erected in connection with the Hams Hall generating station at Birmingham, England, will, its designers say, take precedence as the biggest in the world. It is to rise to a height of 220 ft. and will have a diameter of 168 ft. at the base. It is the first of two towers each capable of cooling the circulating water required for a 30,000-kw. turbine. The foundations of the station are nearing completion, and an electrically operated overhead crane with a lifting capacity of more than 150 tons is ready to install the first large alternator. The cost of the first unit of this plant is estimated at approximately $7,500,000.

New Jersey Power & Light Awards Contract for 50,000-Kw. Turbine.—The New Jersey Power & Light Company, subsidiary of the General Gas & Electric Corporation, has awarded to the General Electric Company a contract for a 50,000-kw. turbine to be installed in the new steam generating station of the power company at Holland, N. J., on the Delaware River and operated at 1,200 lb. pressure. Construction work on this plant, which is to represent an investment of approximately $5,000,000, is now actively under way, and it is planned that this new generating unit of the Pennsylvania-New Jersey power system shall be ready for operation early in 1929. The station will be tied in with the Metropolitan Edison system, another General Gas & Electric subsidiary.

**Texas City's Coming Power Plant.**—The new steam power plant of the Texas-Louisiana Power Company at Texas City, Tex., will be completed soon at a cost of $300,000. The first unit will be placed in operation early in July. Transmission lines are being constructed from the plant to La Marque and a number of other towns in the Gulf Coast region. The plant also will furnish power and light for Texas City itself.

**Eastern Shore Generating Plant in Full Operation.**—The million-dollar 12,000-kw. generating plant at Vienna, Md., now owned by the Insull interests and operated by the Eastern Shore Public Service Company of Salisbury, Md., is now virtually in full operation, that company reports, and serves 17,000 customers over 294 miles of transmission lines and 315 miles of distribution lines. It is the largest generating plant on the tri-state peninsula made up of Delaware and parts of Maryland and Virginia and sometimes distinguished as "Delmarva."

**Rural Rate Reductions on San Joaquin System.**—Reductions in rates for agricultural power on the system of the San Joaquin Light & Power Corporation in Merced, Mariposa, Madera, Fresno, Tulare, Kings and Kern Counties, which will result in an estimated saving of $250,000 a year, have been ordered by the California State Railroad Commission. The new rate schedule will become effective April 1, 1929. It resulted from informal negotiations conducted between representatives of the corporation and the California Farm Bureau Federation.

**Kansas Commission Refuses to Order Rate Reduction for Wichita.**—Present rate schedules of the Kansas Gas & Electric Company for Wichita will continue in force, the Kansas Public Service Commission has decided. The city of Wichita sought to compel the company to lower its charges, on the ground that Wichita, the largest city on the system, enjoys no advantage over smaller towns in the matter of rates and that a city of approximately 100,000 population shrould pay less for its electricity than places having a population of only a few hundred.

**Mid-Hudson Region of New York Gets Another Rate Decrease.**—The Central Hudson Gas & Electric Corporation of Poughkeepsie, N. Y., has announced another reduction in its rates for all classes of electrical customers, to become effective on bills rendered on and after July 15. The reduction represents a total net annual saving to customers in the territory served of $75,000. This is the second rate reduction since the consolidation on Jan. 1, 1927, of the separate companies which formerly operated in the central Hudson region and the fifth rate reduction since 1924.

# Commission Rulings

**New Jersey Commission Refuses Jurisdiction Over Contract for Special Industrial Service.**—A contract between E. I. Dupont de Nemours & Company and the Atlantic City Electric Company by which the latter agreed to construct an additional line of poles to serve the former, which in turn was bound to take service for a number of years at a compensation sufficient to amortize the capital expenditure, was not passed upon by the New Jersey Board of Public Utility Commissioners, which found that it came within the class of contracts for special service between public utilities and certain consumers that do not require the approval of the board. The fact that happenings at some future time might bring the matter within the board's jurisdiction could not be anticipated, since they might never arise.

**Company Not to Blame for Unsatisfactory Service to Direct-Current Elevator.** — Complaint against inadequate electric service furnished by the Grays Harbor Railway & Light Company in Aberdeen, Wash., was made by a customer who alleged that to this was due difficulty in operating the elevators in his five-story building. It was determined that 370 volts potential was required to hold the brakes on the elevator in a released position, and that if the voltage was less, the brakes would not release and the elevator could not be operated without great inconvenience to the tenants. Voltage at the power house was between 595 and 600, but when traffic was heavy the voltage was frequently reduced below 370. The Department of Public Works dismissed the complaint, pointing out that the elevator was installed in the year 1910 at a time when alternating-current elevators had not been perfected and that the company did not then furnish and had not since furnished direct-current service from a commercial line. Service furnished to the elevator was declared to be as good as it ever was. It appeared that one of two things was necessary to give satisfactory elevator service—either to install alternating-current equipment or to build a line direct to the power house. The department was unable to find any reason why the public utility company should bear any portion of the cost of either.

**Metering Energy to Rural Customer Owning Her Transmission Line.**—In denying an application by the Iron River Water, Light & Telephone Company to increase its rural electric rates to a single customer owning her own transmission line, an unusually long one, the Wisconsin Railroad Commission ordered an adjustment of the method of metering previously followed on the line, of which it said it had no authority to authorize the company to assume ownership, and the frequent and unexplainable necessity for meter repairs on which constituted, it asserted, a burden from which the special-contract consumer was entitled to relief. The commission held the most satisfactory solution of the metering problem to be the installation of two meters on the secondary side of the transformers, one for lighting circuits and the other for motors, in view of the fact that such meters are less expensive than primary metering equipment and also because of the protection from lightning or other voltage disturbances. The objection that such local meters would not record transformer losses was held illogical where the primary metering of the type employed did not register more than a small fraction of such losses. The core loss could be accurately estimated, the commission said. Moreover, the core loss and copper losses were more than offset by the value to the company of that portion of the extension used in the service of other customers.

# Recent Court Decisions

**Borough Which Allowed Wire in Park to Sag Within Reach of Children Negligent.**—In Novak vs. Borough of Ford City, a suit for damages because of injury to an eight-year-old boy who seized a sagging wire conveying electricity for lighting purposes to a monument in a park, the trial court found for the plaintiff, and the Supreme Court of Pennsylvania has confirmed the finding. The vertical distance of the wire at the time of the accident from a small mound on which children were accustomed to play was estimated by different witnesses at from 4 ft. to 6½ ft. It was maintained by the defendant that the boy jumped and caught hold of the wire and had climbed on the monument base with that purpose. These actions, if performed, were natural on the part of a child and to be anticipated, the court said, and, though there was no proof of actual notice to the borough that the wire was sagging, there was ample proof of constructive notice, the same condition having been complained of as far back as the preceding summer. (141 At. 496.)*

**Vested Rights, Privileges and Franchises Cannot Be Impaired by Ordinance.**—Declaring void an ordinance of the Borough of Montvale regulating the erection and maintenance of poles, wires and accessories for the transmission of energy, the Supreme Court of New Jersey has declared in a suit brought against the borough by the Rockland Electric Company that "where a borough ordinance has given to an electric light company permission to erect upon the streets and public places in the borough poles and appliances for the carrying and transmission of electrical current, the streets and public places have been designated for such purpose in such ordinance, and the company has expended money in the prosecution of its business in reliance upon said ordinance, the rights, privileges and franchises granted thereby are vested and cannot be repealed or impaired by the passage by the borough council of an ordinance requiring the obtaining of a new consent from the mayor and borough council." (141 At. 673.)

# News About Men of the Industry

### *P. S. Gregory New President of Canadian Association*

P. S. Gregory, assistant to the vice-president and general manager of the Shawinigan Water & Power Company, has been elected president of the Canadian Electrical Association for the coming year. He has been in the utility business since 1912, starting first in the traction field and entering the electric light and power field in 1918. At that time he became electrical engineer of the Shawinigan subsidiary distribution companies, later (1922) growing into his present executive position, where negotiation of large power contracts constitutes a major function. Mr. Gregory was graduated from Bishops University and McGill University with B.A. and B.Sc. degrees respectively. He has been on the executive committee of the Montreal branch of the Engineering Institute of Canada, chairman of the meter and power sales bureaus of the Canadian Electrical Association and a member of the Electric Club of Montreal.

*P. S. Gregory*

George Clinton Ward, executive vice-president of the Southern California Edison Company, was awarded the honorary degree of doctor of science at Oberlin College on June 19 in recognition of his work in applying the results of scientific research to the field of electrical and mechanical engineering.

George Kidd, for many years president of the British Columbia Electric Railway Company, Ltd., Vancouver, has been made president of the British Columbia Power Corporation, which now controls the former company and all its subsidiaries. W. G. Murrin, for a long period vice-president of the British Columbia company, has become vice-president of the British Columbia Power Corporation and A. T. B. Goward will continue to occupy a similar position with headquarters in Victoria. Sir Frank Barnard and Blake Wilson are members of the board of directors. Mr. Kidd, who recently returned to Vancouver from eastern Canada, where he attended a conference of the new owners of the company, stated that he had been assured that the past policy and management of the electric railway company would be continued and that there was not the slightest intention on the part of the new owners of interfering in any way with the rates or affairs of the company as they have been conducted for many years.

Robert A. Millikan, director of the Norman Bridge Laboratory of Physics of the California Institute of Technology, was awarded the honorary degree of doctor of science by Princeton University at the recent commencement exercises. Dr. Millikan won this recognition as a result of his scientific studies on the electron. The citation read: "In the history of modern physics his work will always have a conspicuous place."

George M. Gadsby, president of the West Penn Power Company, was made the recipient of the honorary degree of doctor of engineering by the University of Pittsburgh at the recent commencement exercises. The interest of Mr. Gadsby in the promotion and development of educational programs within and without his company and in developing educational opportunities for those within his company's employ was cited by Dean Holbrook of the university as one of the reasons for the awarding of the degree. Mr. Gadsby is a graduate of Marietta College and of the Massachusetts Institute of Technology. He received his master of arts degree at Marietta College and this month was elected a member of its board of trustees.

Stuart M. Cooper, president of the South Carolina Power Company, has resigned after an association with the Charleston utilities of nine years to affiliate himself with the United Gas Improvement Company, Philadelphia. The U.G.I. organization owned the public service company in Charleston until 1926, when the Charleston Consolidated Railway & Lighting Company was bought by the Southeastern Power & Light Company. Prior to removing to the South Mr. Cooper had been connected with the United Gas Improvement Company since 1907. A graduate of Syracuse University in electrical engineering, he served as assistant engineer of the Syracuse Lighting Company, subsequently entering the employ of the New York & Queens Electric Light & Power Company. After a period of three years he was transferred to the Counties Gas & Electric Company, Norristown, Pa., subsequently removing his interests to the main office of the United Gas Improvement Company. In 1919 he became general manager of the Charleston company, later vice-president and two years ago president.

### *Luke Bradley Resigns*

Luke C. Bradley, president of the Rhode Island Public Service Company, which some time ago took over the United Electric Railways and the Narragansett Electric Lighting Company, announced on June 23 that he will submit his resignation to the directors of the company at their July meeting. The resignation is to become effective Aug. 1. He will assume an executive position with the Electric Bond & Share Company, New York.

Early in February, 1927, Mr. Bradley was elected president of the service company, to succeed Louis C. Gerry. Mr. Bradley resigned a similar position with the Virginia Electric & Power Company to accept the Providence offer. Associated with Stone & Webster, Inc., of Boston, in executive positions for 22 years, Mr. Bradley had varied experience as directing head of utility companies in different parts of the country. As president of the Virginia company he had direct supervision over electric light and power properties, street railways, bus systems and gas properties extending over 40 cities in Virginia and North Carolina. He was also executive vice-president and division manager of utility properties under the management of Stone & Webster in the Southwest and is recognized as one of the most successful executives in the public utility field.

*L. C. Bradley*

It is reported that Frank D. Comerford, president of the New England Power Association, will succeed Mr. Bradley as president of the Rhode Island Public Service Company.

E. P. Peck, whose resignation as vice-president of the Utica (N. Y.) Gas & Electric Company, was announced in the April 21 issue of the Electrical World, has been appointed to the position of engineer of special studies for the New York Power & Light Corporation with offices in Albany. During his association with the

Utica utility, which dated back to 1919, he was responsible for the engineering of the extensive transmission and distribution lines at Utica, New Hartford and Deerfield and the building of those at Ilion, Little Falls and Dolgeville.

## *E. Donald Tolles Directs Wholesalers' Association*

*E. D. Tolles*

E. Donald Tolles, who was elected managing director of the National Electrical Wholesalers' Association at the recent convention held in Hot Springs, Va., as announced in the June 9 issue of the Electrical World, brings to his new executive position a broad background of experience in association work. After a business career covering a period of ten years, he became associated in managing a number of societies and trade associations with Franz Neilson, whom he succeeded as secretary of the New York Electrical Credit Association in 1920. Mr. Tolles first became identified with the Electrical Supply Jobbers' Association, forerunner of the National Electrical Wholesalers' Association, in 1917, as secretary of its Atlantic Division and four years later he was appointed its national representative, in this position acquainting himself with a large number of both manufacturers and jobbers throughout the United States. He more recently served as executive secretary of the association before assuming the duties of managing director.

Mr. Tolles is a native of Attice, N. Y. During the war he was active in Washington in the interests of the industry, devoting particular attention to the cause of the jobbers.

---

Walter G. Jens has been appointed manager of the Pittsburgh branch of the Byllesby Engineering & Management Corporation, having formerly served as general superintendent of that corporation. Mr. Jens went to Pittsburgh in 1926 from Minneapolis, where he had been in charge of construction work for the Northern States Power Company for about ten years prior to that time. When the Pittsburgh branch of the Byllesby corporation was organized on Jan. 1, 1927, Mr. Jens was general superintendent of construction and in December of that year was made acting manager. His appointment as manager was made the occasion of a dinner in his honor on June 18, at which M. R. Sumner, general superintendent of construction, reviewed Mr. Jens' work and paid tribute to his executive leadership.

Maurice A. Oudin, vice-president of the International General Electric Company, Inc., who has just returned from a trip to Europe, was decorated with the order of Commander of the Crown of Italy.

James G. Harbord, president of the Radio Corporation of America, was awarded the honorary degree of doctor of laws by Yale University at the recent commencement exercises held in the Woolsey Hall Auditorium at New Haven.

## *T. A. Kenney Elected to New Executive Position*

T. A. Kenney, who recently became a director of the Commonwealth Power Corporation, has been elected a vice-president and director of the Allied Power & Light Corporation, which was formed recently to consolidate the interests of Hodenpyl, Hardy & Company, Inc., and Stevens & Wood, Inc. Mr. Kenney at an early age entered the employ of the Hudson River Power Transmission Company, which subsequently became a part of the Adirondack Water Power Corporation. This early association, which afforded first-hand experience with the electrical industry, included not only high-voltage power transmission but local electric distribution, industrial power application and electric railway operation as well. In 1912 Mr. Kenney joined the Hodenpyl, Hardy organization in the capacity of manager of the production and transmission department of the Consumers Power Company with headquarters at Jackson, Mich. That company was then consolidating a great many widely scattered hydro-electric companies in the state and interconnecting them, all of which required further pioneering work. Four years later he came to New York as assistant to B. C. Cobb in charge of operations of the Hodenpyl, Hardy properties which comprise one of the largest public utility groups in the United States.

In addition to his executive duties, Mr. Kenney has been prominently identified with the National Electric Light Association and the American Electric Railway Association activities. He is at present a member of the public policy committee of the National Electric Light Association, and in addition to being a member of the executive committee of the American Electric Railway Association is chairman of the finance committee of that organization. In addition to his duties with the Commonwealth Power Corporation and the Allied Power & Light Corporation Mr. Kenney is vice-president and a director of a number of other utility companies.

*T. A. Kenney*

# Obituary

William Lund, a pioneer inventor in the electrical field, died at Hull, Mass., June 19, at the age of 87. Mr. Lund was a native of Bradford, England, and retired from business in Philadelphia ten years ago.

Walter Claude Johnson, who was associated with the electrical industry in Great Britain in its early days, died June 2 near London in his eightieth year. Following an engineering apprenticeship, Mr. Johnson received an appointment with the Telegraph Construction & Maintenance Company, in which position he obtained experience in the laying of submarine cables and the manufacture of machinery for that purpose. In 1876, in conjunction with S. E. Phillips, he founded the business of Johnson & Phillips, Ltd., Charlton, England. Following the introduction of electric lighting, the partners engaged in the production of generators and arc lamps, and subsequently undertook the manufacture of insulated wires and cables.

Charles A. Harber, long identified with the electrical industry in Kansas City, Mo., died at his home in Fairmount, Mo., after a long illness. Mr. Harber was general superintendent of the Kansas City Power & Light Company for 27 years, having retired in 1910. He was 68 years of age.

Thomas S. Marlowe, who directed the installation of the electric light plant at Holden, Mass., died June 12 at his home in that town. Mr. Marlowe was superintendent of the Holden plant for 35 years and was a native of Underhill, Vt., where he was born 62 years ago.

# Financial and Statistical News

## Missouri Utility Makes New Offering

During the past week the Missouri Power & Light Company issued first mortgage 4½ per cent gold bonds, series B, to the amount of $1,500,000, the price being 92¼ and accrued interest, to yield 5 per cent. These securities, dated May 1, 1928, and maturing May 1, 1958, will constitute a direct obligation of the company and will be secured by a first mortgage on the entire fixed property of the company now owned or to be hereafter acquired, subject, however, to underlying mortgage liens, if any, on future acquisitions by the company. The proceeds from the sale of this issue of bonds will be used to reimburse the company for property additions, expenditures for which have been or are to be made.

## Commonwealth Power Pays Larger Common Dividend

The directors of the Commonwealth Power Corporation have declared a quarterly dividend of 75 cents per share on the common stock, payable Aug. 1 to holders of record July 12. From Aug. 1, 1927, to May 1, 1928, inclusive, quarterly dividends of 62½ cents per share were paid on this issue, and in addition the company on May 1 last paid an extra dividend of 50 cents per share. R. P. Stevens was elected vice-president and director and also a member of the executive committee and T. A. Kenney and H. S. Scarritt were elected members of the board, succeeding Earl S. Colman, W. M. Flook and Waldo S. Reed.

## New French Holding Company Formed

Formation of a new holding company, organized by American and French interests for the purpose of taking an active part in the development of the electrical industry in Europe through the acquisition of stocks, was announced during the past week. The company, which will be known as Compagnie Franco-Americaine pour l'Electricité et l'Industrie, will have a capitalization of 50,000,000 francs. The group interested in the formation of the company consists of Blair & Company, Inc., l'Union des Mines, Banque Compagnie Générale d'Electricité, l'Union Houillère Electrique.

CENTRAL PUBLIC SERVICE TO READJUST STRUCTURE.—At a general meeting to be held July 9 directors of the Central Public Service Corporation will propose to the stockholders a number of amendments which will result in a comprehensive plan for the readjustment of the financial structure. It is proposed to give the class A stock priority over the common stock to the extent of $1.75 a share per annum in earnings and $30 a share in liquidation. In addition the class A stock will participate equally with the common in earnings and surplus in liquidation after the common stock has received an amount equivalent to the class A priority. At the present time the class A stock is limited to a maximum of $2.50 a share per annum in dividends and to a maximum of $25 a share in liquidation, in priority to the common stock. This readjustment of the company's financial structure will enable the organization to exercise greater flexibility and economy in taking care of future requirements for growth and expansion.

JERSEY COURT ENJOINS FINANCE COMPANY.—An injunction has been granted by Vice-Chancellor Berry to the Public Service Corporation of New Jersey restraining the Public Service Finance Corporation of Newark from using the words "Public Service" as part of its title. At the hearing affidavits were filed to show that the Public Service Finance Corporation, which was incorporated to do a personal loan business, was not connected financially or otherwise with the Public Service Corporation or with any of its subsidiaries.

## German Utility Company Floats New Loan

The East Prussian Power Company made an offering of first mortgage sinking fund gold bonds, amounting to $3,500,000, at 91 and interest, yielding 6.75 per cent. These securities, dated June 1, 1928, mature June 1, 1953. They will be secured by a direct first mortgage, ranking equally with an existing mortgage securing approximately $553,572 5 per cent internal bonds, on substantially all the fixed properties of the company.

## Public Service Corporation in Economical Operating Position

IN SHARP contrast to the situation in the case of some of the larger utility systems with properties scattered to the four corners of the country, the Public Service Corporation of New Jersey has its assets of over $615,000,000 segregated within a compact area between New York and Philadelphia. The system has reached its present prominent position among the nation's twelve leading utility groups by natural growth, over the past two decades, rather than by the purchase of any important new properties.

Public Service Corporation's common stock has yielded large returns, but more moderate than in the case of some of the other holding company issues. The average price of the stock during 1923 was $46. After a three-for-one split a current price of the stock, on the original basis, would be around $160. Common dividends have been paid uninterruptedly since 1907. On the original $100 par stock a dividend of $4 was paid in 1920 and 1921. This was steadily increased to an $8 rate in 1923, when shares were split two-for-one. On the new stock $5 was being paid until 1926, when the three-for-one split referred to was effected. Thus the current rate of $2 is equivalent to $12 on the original shares. Furthermore, from 1924 to 1926 the corporation gave five allotments of common stock for subscription, and in November last and January of this year shareholders were offered rights for 6 per cent preferred stock and 4½ per cent debentures with a combined maximum per share worth of 96 cents.

After dividends, surplus earnings have been consistently turned back into the improvement of properties and equipment. Refunding of bonds at lower interest rates during recent months has made possible a saving of more than 20 cents per common share annually. Furthermore, appropriations of 19 per cent of gross revenues for maintenance, depreciation and retirement expenses are larger than in the case of most similarly situated companies. The operating ratio for the system as of Dec. 31, not including maintenance charges, was 42.6 per cent. Fixed capital of the system amounted to $4.47 per dollar of gross.

The Public Service Corporation has followed the customer-ownership policy with marked success. At the end of last year there were 89,769 accounts on the stock ledgers, against 67,303 the year before. In addition there were 18,912 open accounts with subscribers.

Capitalization is represented by $29,079,000 guaranteed stocks of leased companies, $108,613,000 6 per cent preferred stock, including that of the operating gas and electric subsidiary; $28,908,000 7 per cent and $21,531,000 8 per cent preferred stock, as well as 4,153,613 shares of no-par common stock. The funded debt at a recent date totaled $289,460,000.

## Record Hydro Output

The production of electrical energy by the use of water power in April established three records, the United States Geological Survey points out. More electricity was produced in a month than ever before, 29,400,000,000 kw.-hr.; the average daily rate of production of electricity by water was also the largest, 98,000,000 kw.-hr., and the proportion of the total output produced by water power was the largest of record, 43 per cent. More than 2,700,000 tons of coal would have been required to generate the electricity produced by water power in April. These totals apply to all energy generated in public utility plants, including those for electric railway and other plants as well as those for light and power. The former, however, constitute only a small fraction of the total. Corresponding data for central-station output were published in the résumé of operations of the industry in the Electrical World of June 23, 1928.

**Empire Power Resumes Dividend.**—The directors have declared a dividend of 50 cents per share on the participating stock, payable July 1 to holders of record June 21. Quarterly dividends at this rate were paid from October, 1926, to October, 1927, inclusive, but none has been paid since that date.

**Recent Listings.**—The New York Stock Exchange has authorized the listing of $1,003,000 additional 30-year first lien stamped 5 per cent sinking fund gold bonds of the Federal Light & Traction Company, due March 1, 1942, making the total applied for $3,823,500 in 5 per cent bonds, $3,482,000 stamped 6 per cent bonds and $3,203,500 stamped 5 per cent bonds. There have also been authorized for listing on the New York Exchange 5,251 additional shares of common stock, class A, of the General Gas & Electric Corporation, without par value, on official notice of issuance and payment in full, making the total amount applied for 356,160 shares. Convertible gold debentures of the Public Service Corporation of New Jersey have been authorized for listing on the New York Exchange to the amount of $24,719,500. These securities, bearing interest at the rate of 4½ per cent mature Feb. 1, 1948. The New York Stock Exchange has also authorized the listing of 141,000 additional shares of class A stock of the Utilities Power & Light Corporation (without par value) on official notice of issuance and payment in full, making the total amount applied for 725,000 shares of class A stock.

## Ontario Commission Issues Report

The Ontario Hydro-Electric Power Commission reports a net surplus of $1,291,986 for all hydro municipalities for the fiscal year ended Dec. 31, 1927. Total revenue collected by the electrical utilities during that period was $24,583,022. The cost of power was $13,652,712; cost of operation, maintenance and administration, $4,681,466; debenture charges and interest, $3,694,855. Depreciation is set at $1,262,000. The total investment of the commission in power undertakings and hydro-electric railways is $204,372,066, and the investment of the municipalities in distributing systems and other assets is $81,792,678, making in power and hydro-electric undertakings a total investment of $286,164,745. The total revenue derived from this capital investment aggregated $34,056,707 in 1927.

BARCELONA TRACTION PAYS EXTRA DIVIDEND.—Directors of the Barcelona Traction, Light & Power Company, Ltd., have declared an extra dividend of 1 per cent and the quarterly dividend of 1¾ per cent on the non-cumulative participating preferred stock, all payable June 30 to holders of record June 21. An extra distribution of like amount was made on this issue on June 30, 1927.

CONNECTICUT UTILITY INCREASES CAPITAL.—The Rockville-Willimantic Lighting Company, Willimantic, Conn., will increase its capital stock, as recommended by directors and approved by stockholders of the company, by issuing 11,996 shares of common stock of no par value and 1,000 shares of preferred stock par value $100. The latter issue will be offered to stockholders at par on July 1 at the rate of one share of new stock for each eight shares of old stock. There is $800,000 of preferred stock outstanding.

MASSACHUSETTS UTILITY CHANGES PAR OF STOCK.—The Webster & Southbridge Gas & Electric Company, Webster, Mass., has been authorized to change the par value of the company's stock from $100 to $25 and to offer an additional stock issue of $400,000.

NORTHEASTERN POWER DECLARES INCREASED COMMON DIVIDEND. — The directors of the Northeastern Power Corporation have declared a quarterly dividend of 25 cents per share on the common stock and the usual quarterly dividend of $1.50 per share on the class A stock, both payable July 1 to holders of record June 15. From July 1, 1927, to April 1, 1928, inclusive, the corporation paid quarterly dividends of 15 cents per share on the common stock.

INDIANA UTILITY INCREASES CAPITAL.—The Liberty Light & Power Company of Richmond, Ind., has filed papers with the Secretary of State increasing its stock from $75,000 common and the same amount preferred to $125,000 common and the same amount preferred.

OHIO RIVER EDISON DOUBLES STOCK. —The Ohio River Edison Company has increased its 7 per cent cumulative preferred stock from 60,000 to 120,000 shares of $100 par value and its no-par common stock from 300,000 to 600,000 shares.

# Reanalysis of Power Possibilities in Canada

DURING 1927 a reanalysis of the power possibilities in various districts throughout Canada has resulted in an increase in the total estimated available figures for the Dominion in spite of the fact that a recent judgment of the Privy Council takes from Canada and adjudges to Newfoundland a considerable area in Labrador, previously regarded as part of northeastern Quebec, in which large water powers are located. The most recent figures for the Dominion indicate the total resources to be 20,197,000 hp. under conditions of ordinary minimum flow, or 33,113,000 hp. ordinarily available for six months of the year.

The figures for available water power listed in the accompanying table are based upon rapids, falls and power sites of which the actual existent drop or the head possible of concentration is definitely established or at least well authenticated. Many rapids and falls of greater or lesser power capacity are scattered on rivers and streams from coast to coast which are not as yet recorded, and which will only become available for tabulation as more detailed survey work is undertaken and completed. This is particularly true in the relatively unexplored northern districts. Nor is any consideration given to the power concentrations which are feasible on rivers and streams of gradual gradient, where economic heads may be created by the construction of power dams, excepting only at points where definite studies have been carried out and the results made matters of record. In brief, the figures hereunder are based on definite rapids, falls and power sites, and may be said to represent the minimum water-power possibilities of the Dominion:

| Province | Available 24-Hour Power at 80 Per Cent Efficiency At Ordinary Min. Flow, Hp. | At Ordinary Six Months Flow, Hp. | Turbine Installation, Hp. |
|---|---|---|---|
| British Columbia | 1,931,000 | 5,103,500 | 473,142 |
| Alberta | 390,000 | 1,049,500 | 34,107 |
| Saskatchewan | 542,000 | 1,082,000 | 35 |
| Manitoba | 3,309,000 | 5,344,500 | 255,125 |
| Ontario | 5,330,000 | 6,940,000 | 1,816,908 |
| Quebec | 8,459,000 | 13,064,000 | 2,064,723 |
| New Brunswick | 87,000 | 120,800 | 47,231 |
| Nova Scotia | 20,800 | 128,300 | 70,017 |
| Prince Edward Island | 3,000 | 5,300 | 2,434 |
| Yukon and Northwest Territories | 125,200 | 275,300 | 13,199 |
| Canada | 20,197,000 | 33,113,200 | 4,777,921 |

It is believed that these are conservative estimates, since an analysis of the water-power plants scattered from coast to coast concerning which complete data are available as to turbine installation and satisfactory information as to stream flow gives an average machine installation 30 per cent greater than the ordinary six-month flow power. Applying this, the figures quoted above, therefore, indicate that the present recorded water-power resources of the Dominion will permit of a turbine installation of approximately 43,000,000 hp.

---

PHILADELPHIA COMPANY PAYS EXTRA DIVIDEND.—Directors of the Philadelphia Company have declared an extra dividend of $1.50 per share on the common stock, payable July 31 to holders of record July 2. The regular quarterly dividend of $1 per share on this issue, previously declared, is payable on the same date.

MASSACHUSETTS UTILITY AUTHORIZED TO ISSUE STOCK.—The Massachusetts Department of Public Utilities has authorized the Edison Electric Illuminating Company of Boston to issue 32,230 shares of additional capital stock (par $25) at $45 per share.

---

## Customer-Ownership Sales Rise

After several low months customer-ownership sales of stock rose in April to $19,794,000, involving 422,200 shares in 15,090 transactions, according to monthly reports received from electric light and power companies by the ELECTRICAL WORLD. The average of $1,300 per transaction is exceptionally high; the figure rarely rises above $800 or $900. In the present instance it is due to the combined influence of one campaign, which ran close to $2,000 per transaction, and of heavy sales by several other companies, each averaging well over $1,000 per transaction; the tendency toward sales in rather large blocks was quite general. The total for the month was close to the average for the year 1927, and since the heavy financing of last October was exceeded only in January, and then by 8 per cent.

Revised figures for March indicate the sale in 18,710 transactions of 194,900 shares valued at $11,569,000. The average per transaction, about $620, is in line with that of other months.

In March the sale of $25 shares exceeded $2,500,000 and in April it almost reached $8,000,000. Other shares were sold at prices close to $100. These large sales of low-priced shares account for the average of $60 per share in March and $47 in April.

# Business News and Market Conditions

## Record Manufacturing Operations During May

### Electrical Manufacturing Plants Operating at the Rate of 17 per Cent Above Last Year—May Operations 5.6 per Cent Above April

THE electrical manufacturing industry entered the last month of the first half of the year with a rate of productive operations about 17 per cent over May of last year. Never before has such a high rate of activity been recorded by the industry as was witnessed during the current month of May. The former record activity was recorded in October of last year, but the May rate was about 2.4 per cent over that of last October.

The electrical manufacturing plants closed the year of 1927 in a rather unpromising manner, with a rate of operations about 4.7 per cent under December, 1926. A distinct downward trend was recorded as the year unfolded, March operations being about 8 per cent under those recorded in December. With April, however, came an unexpected radically upward turn, which was continued through May, the increase in the rate of activity for the two months' period being 17 per cent. Such an increase in the operations of these plants was not to be expected at this season of the year, in past years the usual upward turn not being started until September. All indications point to very unusual summer operations by the nation's electrical manufacturing plants.

The smaller electrical manufacturing plants reported a much greater increase of operations than was reported by the larger companies, but practically every plant reported substantial increases over May of last year.

The index of activities in the electrical manufacturing industry based on the consumption of electrical energy stands at 134.6 for May, as compared with 128.4 for April and 131.3 for the former record month of October, 1927. Comparative indexes of productive activity referred to the average of the period 1923-1925 as 100 and adjusted for number of working days are as follows:

| | |
|---|---|
| May 1928 | 134.6 |
| April, 1928 | 128.4 |
| March, 1928 | 115.3 |
| May, 1927 | 115.0 |
| Average first five months 1928 | 124.9 |
| Average first five months 1927 | 116.4 |

General industry has not recorded the same upward swing and record operations witnessed by the electrical manufacturing plants. Consumption of electrical energy by more than 3,000 large manufacturing plants in the United States in May was 0.2 per cent under the rate established in April and 1.3 per cent below that for the corresponding month last year. This is the first time since last September that industrial activity dropped below that of the same month in the year previous. May was the peak month of general industrial activity in 1927, while in the current year so far the high point was reached in February.

---

## Lighting Fixture Award in National Competition

At the national competitive exhibit of residential luminaires held in connection with the convention and exhibit of the Artistic Lighting Equipment Association at Chicago this month a number of awards were offered for the development of something new in the line of lighting fixtures. The awards were intended to serve as a stimulus to the development of a new thought in fixtures, which it is expected will have sufficient power to encourage and make possible a refixturing activity.

The competition was held under the joint sponsorship of the committee on resident lighting equipment of the Association of Edison Illuminating Companies, the home lighting committee of the National Electric Light Association and the Electric Association of Chicago.

Prizes for units listing above $30 were made as follows:

First Prize, $300—Beardslee Chandelier Manufacturing Company.

Second Prize, $200 each—Duplexalite Division of the Miller Company and R. Williamson & Company.

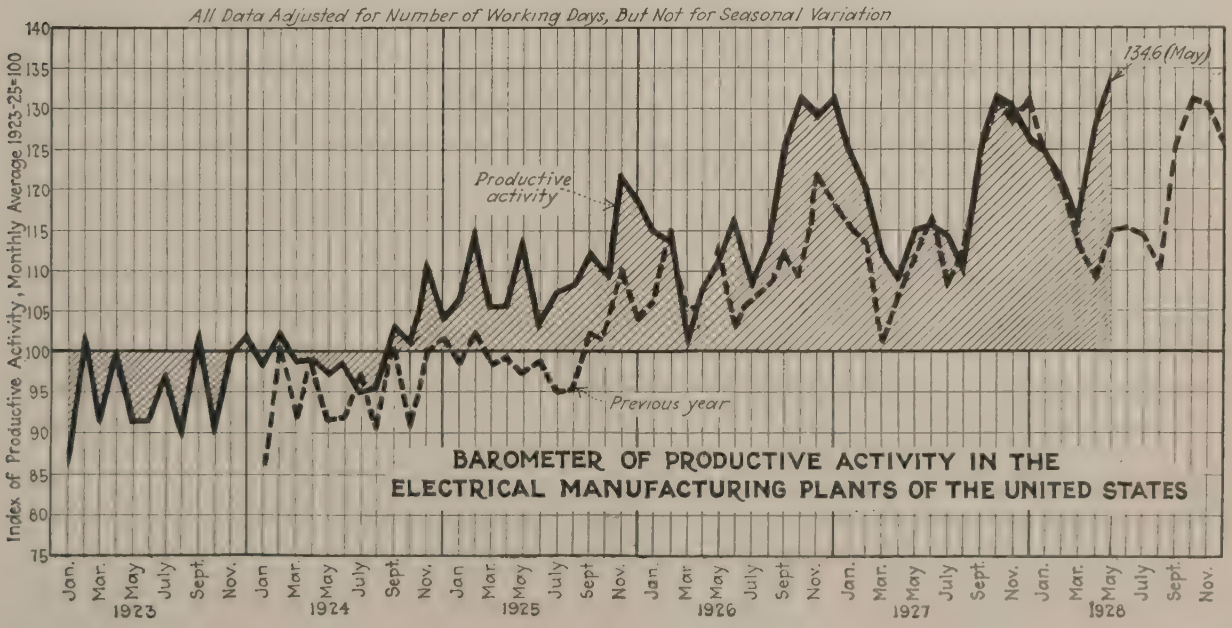
Honorable mention to the Edwin F. Guth Company.

Prizes for units listing below $30 were:

First Prize, $300—Miller Company.

Second Prize, $200—Lightolier Company.

The awards were made on the basis



All Data Adjusted for Number of Working Days, But Not for Seasonal Variation

BAROMETER OF PRODUCTIVE ACTIVITY IN THE ELECTRICAL MANUFACTURING PLANTS OF THE UNITED STATES of the best combination of the three essential factors that should be embodied in all equipment for home lighting:

1. Quality of illumination gaged by a sufficient quantity of light given without glare and objectionable shadows.
2. Excellence of workmanship in mechanical and electrical construction.
3. Artistry of design when viewed both lighted and unlighted in natural surroundings.

The two first of these factors were readily measured by scientific standards and all fixtures were tested in these respects in the Electrical Testing Laboratories, New York.

The third factor, that of beauty and appropriateness of design, was based on the aid offered by the lighting units to the American homemaker in having the equipment conform to the high standards of modern home decorating. The following constituted the board of judges: Harry H. Bentley, American Institute of Architects; W. McKee, Art Institute, Chicago; C. G. Everson, Artistic Lighting Equipment Association; L. H. Lamont, Association of Electragists International; L. V. James, Electric Association, Chicago; P. S. Millar, Electrical Testing Laboratories; W. H. Rademacher, Illuminating Engineering Society; E. D. Tillson, National Electric Light Association, and Mrs. Winifred Hathaway, National Society for the Prevention of Blindness.

# Market Conditions

CENTRAL-STATION companies are buying line equipment and supplies in New England in increasing volume. Industrial orders are steady with small motors in good demand. An improved tone is noted in the Eastern market. A Maryland utility plans a generating plant to cost $500,000 and a New York engineering firm is planning a 30,000-hp. power plant in connection with an electric smelter to cost $5,000,000. A steam railroad purchased $75,000 worth of motor-generator sets for headlight service. Steel and iron mills, cement mills and chemical plants are prominent factors in current industrial commitments.

An increase in orders, both as to number and size, is reported in the Southeast. A new paper mill in Alabama will require more than $1,000,000 worth of electrical material. An improved tone continues in the St. Louis district. In the Middle West the volume of business transacted is increasing. On the Pacific Coast industrial plant buying has been active. Miscellaneous wiring and line material was purchased by a Utah smelter, $6,000 worth of turbine spare parts by a sugar refinery, and 72 motors by the National Paper Products Company.

## *Metal Markets Quiet and Steady*

Buying of each of the non-ferrous metals has been of modest proportions during the past week. Prices are for the most part unchanged, copper continuing at 14¾ cents Connecticut and lead at 6.30 cents in New York and 6.15 cents in St. Louis. Zinc is a little firmer than a week ago, forward position commanding as high as 6¼ cents.

NEW YORK METAL MARKET PRICES

| | June 20, 1928 Cents per Pound | June. 27, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic..... | 14.525 | 13.75 |
| Lead, Am. S. & R. price | 6.30 | 6.30 |
| Antimony.............. | 9½ | 9½ |
| Nickel, ingot........... | 35 | 35 |
| Zinc spots.............. | 6.50 | 6.55 |
| Tin, Straits............. | 47 | 47 |
| Aluminum, 99 per cent... | 24.30 | 24.30 |

Base copper wire price June 27, 1928, 16⅝ cents.

## *Increase in Orders Reported in Southeast*

Business is improving in the electrical field with increases noted in orders, both as to number and size. The largest order placed was for oil circuit breakers amounting to $100,000 for a power company in the western portion of the territory, while transformer and switching equipment amounting to $60,000 was ordered by a power company in Florida. Another central-station company ordered creosoted pine poles amounting to $10,000 and pole line hardware totaling $2,500. Some other central-station orders were for house type watt-hour meters amounting to $6,800, distribution and small power transformers amounting to $4,100 and poles totaling $2,200.

The electrical material requirements of a new paper mill being constructed in Alabama will approximate $1,000,000 and will include a 6,000 kw. turbine and three 1,000 hp. boilers. Electrification contracts have been closed on three cotton mills in the Carolinas and the electrical materials for these jobs will total $20,000, $10,000 and $8,000, respectively. A cotton mill in Georgia ordered wiring supplies costing about $6,000, for use in connection with a new mill lighting lay-out. A Georgia municipality ordered electrical pumping equipment amounting to $2,000, while another town in the same state purchased a carload of creosoted pine poles. Construction projects are as follows:

The Selma Compress Company, Selma, Ala., will build a plant, to cost $140,000. The Piedmont Corporation, Atlanta, Ga., plans a rock-crushing plant near Lithonia, Ga., to cost $300,000. The Georgia Power & Light Company, Waycross, Ga., plans extensions in plants to cost $300,000. The Tobacco By-Products & Chemical Corporation, Louisville, Ky., plans a power plant, at its proposed local chemical works, to cost $175,000. The Mississippi Power & Light Company, Jackson, Miss., plans a substation at Lexington, Miss. The Lampton-Reid Company, Magnolia, Miss., will build an electric-operated cotton ginning plant, to cost $50,000. Shelby, N. C., will make extensions in its light and power system to cost $16,000. Standard Looms, Inc., Spartanburg, S. C., will soon ask bids for a textile loom manufacturing plant at East Spartanburg, to cost $300,000. East Ridge, Tenn., plans an ornamental lighting system.

## *Improved Market Tone in Eastern District*

Orders and inquiries in the Eastern district have shown noticeable improvement. A central-station company in New Jersey has placed a contract for a 50,000-kw. turbo-generator unit. A Maryland utility plans an addition to its generating plant to cost $500,000; a New York central station plans a large plant to represent an investment of several million dollars, and a New York engineering company has contracted to install a 30,000 hp. station in Chile.

Steel and iron mills, cement mills and chemical plants are prominent factors in current industrial commitments; the first noted is particularly strong with inquiries for industrial motors and accessory equipment, and future sizable orders are anticipated. A cement mill in Illinois has contracted for a number of motors for grinding mills, waste heat boiler fans and other service, totaling about $35,000. The same manufacturer has also secured an order from a chemical plant in Michigan for motor-generator units to an amount of about $50,000. A paper mill in West Virginia has given a commitment to another maker for a 400 kw. extraction turbine unit for process work, as well as for other apparatus, the total account approximating $100,000. Several automobile manufacturers in Michigan have entered the market for requirements for new plants and good business is looked for from this quarter. Wire and cable business holds satisfactory and the outlook is encouraging.

Philadelphia shows improvement in industrial business. Central station commitments are slow and inquiries have declined. A feature of immediate future business is local railway electrification. The city of Philadelphia has approved plans of the Philadelphia & Reading Railway for a terminal yard at Logan, in connection with proposed electrification of its Germantown and Chestnut Hill branches. Construction operations in the Eastern district include the following:

The J. G. White Engineering Corporation, New York, will build a power plant and electric smelter in Chile for the Electro-Siderurgical de Valdivia, now being organized, to cost $5,000,000. The General Cable Company, New York, will build a plant at Mobile, Ala., to cost $250,000. The Geller Shoe Manufacturing Company, Brooklyn, plans a factory to cost $100,000. The Sealright Corporation, Fulton, N. Y., plans an addition to cost $200,000. The

Koeppen Metal Products, Inc., Union City, N. J., will build a plant at Carlstadt, N. J., to cost $100,000.

The Susquehanna Collieries Company, Mount Carmel, Pa., will electrify its Cameron colliery, to cost $65,000. Drexel Institute, Philadelphia, will build an engineering building to cost $200,000. The Department of Property and Supplies, Harrisburg, Pa., will receive bids July 9, for cast iron lighting standards. Robert N. Dippy, Philadelphia, architect, is preparing plans for a cold storage plant to cost $100,000. The Eastern Shore Public Service Company, Salisbury, Md., plans a power plant at Vienna, Md., to cost $500,000. The International Paint Corporation, St. Helena, Md., plans a plant to cost $100,000.

## *Central-Station Companies Buying in New England*

Expansions of power and service lines in New England are responsible for a gradual increase in the buying of line equipment and supplies. A number of orders for poles, cross arms and wire were reported, including an order for two carloads; several orders for switches and control apparatus were received, and insulators are selling well.

Industrial orders are steady with small motors in good demand. Activity is reported among manufacturers of fractional-horse power motors and the volume delivered in this district to date is in excess of that for the same period last year. Industrial heating is active. One manufacturer reports two orders for Western delivery consisting of 20 kw. and 30 kw. capacities for special heat treating. The general tone of the market is encouraging. Construction projects are as follows:

The Lynn Gas Light & Electric Company, Lynn, Mass., plans to expend $100,000 in linking up stations and connecting with power groups. The New England Power Company, Worcester, Mass., is to connect Pratts Junction with Lowell with a new line. A short line connection to a new transformer station will be soon made by the Randolph and Holbrook Power & Electric Light Company, Randolph, Mass. The Webster & Southbridge Gas & Electric Company, Webster, Mass., plans to expand its plant; a new power plant is planned by the Montan Company, Westboro, Mass. The Holyoke Company, Holyoke, Mass., plans additional machinery at its wire and cable works. The Bureau of Yards & Docks, Washington, D. C., will receive bids until July 5, for automatic refrigerating equipment for the naval station at Portsmouth, N. H. (Specification 5656). The Prairie Window Ventilator Corporation, Providence, R. I., plans an expansion to cost $85,000.

## *Most Sections of Middle West Report Active Business*

Comparatively good business continues in most sections of the Middle West, and the volume is gradually increasing. It is expected that the month of June will show an increase in total business over the month of May. Industrial activity is somewhat spotty, although generally speaking it is considered good, with seasonal depressions here and there. Reports from the automobile industry indicate an excellent condition and the steel and railroad industries apparently are prosperous. There has been a good demand for poles, insulators, and other construction materials. An interesting order covered a 5,000-kva. distribution transformer. Jobbers' sales are normal with a slightly increasing volume of business. Construction projects are as follows:

The Art Engraving Company, Chicago, plans a plant to cost $250,000. Darling & Company, East St. Louis, Ill., plans an addition to its fertilizer plant to cost $100,000. The F. L. Bromley Properties, Inc., Detroit, will build a unit at its automotive plant, to cost $200,000. The Mount Clemens Pottery Company, Mount Clemens, Mich., plans additions, to cost $80,000; Waldron, Inc., Minneapolis, Minn., plans a laundry to cost $200,000. The Glaser Provision Company, Omaha, Neb., plans a packing plant, to cost $100,000. The Pyrometric Laboratory, Columbus, Ohio, plans a factory and laboratory to cost $90,000. The Kohler Company, Kohler, Wis., plans an addition to its pottery plant, to cost $100,000. The Invincible Metal Furniture Company, Manitowoc, Wis., plans an addition to its aircraft plant, to cost $100,000. The Weber Lifelike Fly Company, Stevens Point, Wis., will build an addition to its fishing tackle factory, to cost $80,000. The Houghton County Electric Company, Houghton, Mich., plans an improved lighting system at Red Jacket, Mich.

## *Improved Tone Continues in St. Louis District*

The general condition of business in the St. Louis district continues to show an improved tone. Orders for small motors, transformers and equipment are being placed in good volume and are slightly better than for the same period last year. One order for a lot of motors to drive centrifugal pumps amounted to $1,500. Appliances are selling in good quantity. Fan business is very slow on account of cool weather. Some good-sized contracts for street lighting are being estimated. Utility companies are not buying actively at present. Construction projects are as follows:

C. M. Conoway, Dallas, Tex., and associates, plan an ice plant at Hoisington, Kan., to cost $250,000. The Southwestern Gas & Electric Company, Shreveport, La., plans a 66,000-volt transmission line from Shreveport to Marshall, La. Kennett, Mo., will receive bids until July 17, for Diesel oil engines, and other complete power plant equipment. The Scullin Steel Company, St. Louis, will make extensions, to cost $200,000. The Market Development Corporation, International Life Building, St. Louis, plans a cold storage plant to cost $175,000. The Oklahoma Gas & Electric Company, Oklahoma City, Okla., will build a transmission line from Washington to Etowoh, Okla., about 40 miles, to cost $65,000.

The West Texas Utilities Company, Abilene, Tex., plans a substation at Baird, Tex. The Martha Washington Candies Company, Chicago, plans an addition to its plant at Fort Worth, Tex., to cost $80,000. The Globe-El Paso Cotton Oil Company, Old Fort Bliss, Tex., plans new plants to cost $175,000. The Central Power & Light Company, San Antonio, Tex., will make extensions in its power plant at Falfurrias, Tex., to cost $20,000. Blackwell, Cushing, Lone Wolf, and Temple, Okla., plan ornamental lighting systems.

## *Industrial Buying Active on Pacific Coast*

Industrial plant ordering has been good on the Pacific Coast and includes such orders as miscellaneous wiring and line material for a Utah smelter, $6,000 worth of turbine spare parts for a sugar refinery and a 100-hp. synchronous motor valued at $2,500 for a chemical plant. The state industrial heating load is estimated at and is said to be increasing annually by 10,000 kw. The increasing industrialization of the Pacific Coast is evidenced by the number of plants seeking Pacific Coast locations, such as the Fokker airplane interests, a steel plant and the Seiberling tire people. Hotel construction announced includes a $1,000,000 Biltmore Hotel for Phoenix and a chain of California highway hotels. Other interesting construction includes a $750,000 grain terminal for Portland, new quartermaster's warehouses and office buildings for Fort Mason, San Francisco, and a $1,000,000 apartment house for Seattle, Wash.

Lighting business is now one of the busiest branches of the California electrical industry. New installations are being planned by Madera, Woodland, Chico, San Anselmo, Sonora and Los Banos, and San Jose has awarded a contract amounting to $5,000. Power company purchasing includes miscellaneous maintenance material in small lots. The Pacific Gas & Electric Company's range campaign, lasting eight weeks, has resulted in the sale of 1,147 electric ranges.

The largest motor movement reported in the Puget Sound district included four 150-hp., fifty-four 50-hp. and fourteen from 15 hp. down, for the Chipper plant of the National Paper Products Company. The sale of a 1,000-gallon pump and a 100-hp. steam turbine for a pumping plant also is reported. Seattle is negotiating for the installation of a third generating unit at the Skagit hydro-electric project involving an outlay estimated at $350,000. Construction projects are as follows:

The Verde Central Mines, Inc., Jerome, Ariz., will build a mill and concentrating plant, to cost $150,000. The Evans Auto Loading Company, Detroit, plans a plant at Eureka, Calif., for the manufacture of battery boxes, to cost $100,000. The contracting officer, Quartermaster Corps, Fort Winfield Scott, Calif., will receive bids July 9 for Diesel engines for marine service (Circular 1). The Jacumba Land & Cattle Company, Jacumba, Calif., plans a power plant at Jacumba Hot Springs, to cost $50,000. The John O. Gilbert Chocolate Company, Jackson, Mich., plans a candy plant at Los Angeles, to cost $800,000.

The Great Western Power Company, San Francisco, will make extensions in the power substation at Oakland, Calif., to cost $35,000. The Union Pacific Railway Company, Portland, Ore., plans a grain elevator on Swan Island, to cost $650,000. Bakersfield, Los Angeles, Chico, Los Banos, Hanford, Pasadena, Glendale and San Leandro, Calif., plan ornamental lighting systems.

The Pacific Gas & Electric Company, San Francisco, plans an improved lighting system at San Anselmo, Calif.

# Activities of the Trade

## Westinghouse Battery Sold to New Company

Formal announcement has been made of the sale of the Westinghouse Union Battery Company of Swissvale, Pa., by A. L. Humphrey, president of the Westinghouse Air Brake Company. A new company, known as the Wubco Battery Corporation, has been organized, taking over the equipment, inventory, sales outlets and good will. The new company will be headed by J. L. Rupp as president. Mr. Rupp was a former executive of the old company and has been actively concerned in storage battery development and standards for the past fifteen years. The new company states that the manufacture of the same quality Westinghouse batteries will be carried on in the present plant at Swissvale.

## General Cable to Build Plant in Mobile, Ala.

The purchase of a piece of land on tidewater in the city of Mobile, Ala., has been announced by the General Cable Corporation, which will erect a factory for the manufacture of electrical wires and cables. The officials of the company have for some time past been studying the situation in the Southern states, believing that inasmuch as their factories situated in the northern part of the United States are in a position to serve to good advantage all sections of the country with the exception of the southeastern portion, the addition of a Southern mill would be a logical development of the company's natural facilities.

The General Cable Corporation, which was formed last November, purchased the plants of the Baltimore Rolling Mills, formerly owned by the American Smelting & Refining Company, the Dudlo Manufacturing Company, the Rome Wire Company, the Safety Cable Company and the Standard Underground Cable Company. The corporation, with headquarters at 420 Lexington Avenue, New York, now has fourteen plants making a complete line of all kinds of electrical wires and cables.

**The Cutler-Hammer Manufacturing Company**, Milwaukee, manufacturer of electric controlling devices, announces a new unbreakable attachment plug with an improved type of cord grip, designed particularly to lessen short-circuit hazards. The cord grip cap can be obtained in either bakelite brown or zinc gray finish.

**The Eagle Electric Manufacturing Company**, 59 Hall Street, Brooklyn, N. Y., has placed on the market the new Eagle armor-clad appliance plug. The company also announces that it has adopted a strict wholesalers' policy and its dealer business is being turned over to Eagle distributors to handle; also that Charles F. Copeland has joined the active selling force of the company. Mr. Copeland will act as direct office representative in all territories east of the Mississippi and will help to build up electrical wholesale business.

## "Mazda" Lamp Prices Reduced

For the eleventh time since 1920 the General Electric Company has announced a reduction in the prices of "Mazda" incandescent lamps effective July 1. The reductions average 14 per cent and apply to types which represent about 82 per cent of the total consumption of large "Mazda" lamps. The company states that this reduction brings the prices to less than half, or about 45 per cent, of the 1914 average. This great reduction in price becomes even more impressive when one considers that during the same period the lighting efficiency of "Mazda" lamps has been tremendously increased, the cost of materials has gone up, and the average wage paid to lamp makers has more than doubled.

It is because the public has concentrated the bulk of demand on the five lamps in the standard line of inside frosted "Mazda" lamps that the General Electric Company has been able to achieve increasing efficiency in mass production and greater economies in lamp distribution. The policy of the General Electric Company, as has been declared by President Gerard Swope, is that the savings thus achieved be shared with the public. The policy is again confirmed in the July 1 price reduction, which affords consumers savings of 3 cents and 5 cents on the most widely used types of "Mazda" lamps.

| Lamp Size | Old Price, Cents | New Price, Cents |
|---|---|---|
| 25 watt | 23 | 20 |
| 40 watt | 23 | 20 |
| 50 watt | 25 | 22 |
| 60 watt | 25 | 22 |
| 100 watt | 40 | 35 |

## Brown Boveri Approves Sale of Part of Holdings

The proposal to sell part of the holdings of the American Brown Boveri Corporation, as reported in the June 23 issue of the Electrical World, was approved this week by holders of founders' stock at a special meeting called for the purpose. The company will sell its entire stock holdings in the Moloney Electric Company of St. Louis to Stifel, Nicolaus & Company of St. Louis and its shipbuilding business at Camden, N. J., to Laurence R. Wilder, a director of the American Brown Boveri Company, who, with his associates, has organized the Transoceanic Corporation. Both holdings will be sold for cash. The sales will enable the corporation to retire its bonded debt of slightly more than $5,000,000, to repay its bank loans and to reduce the outstanding preferred stock by $1,000,000.

## Hubbard Adopts Display Truck for Touring Country

Exhibited for the first time at Young's Million Dollar Pier during the week of the 51st National Electric Light Association convention at Atlantic City, the Hubbard "Linebuilder," as shown in the illustration, will be used to demonstrate the company's line of pole-line hardware and Peirce construction specialties. The display truck consists of a 2½-ton White truck chassis with a special body. The equipment is displayed as used in the field and there are a number of loose samples for inspection. It is intended to make a tour of the country with the truck so as to place before companies or individuals interested a complete line of Hubbard products. The tour will be conducted by Hubbard sales engineers, who will have charge of the display truck while it is in their territories.

*Hubbard "Linebuilder" with samples of pole-line hardware and construction specialties displayed as used in the field*

# New Equipment Available

## Switching and Protective Unit for Rural Service

A switching and protective unit that consists of an air break switch, a choke coil and a fuse which can be used on systems where the short-circuit currents may run as high as 5,000 amp. has been developed by the Hi-Voltage Equipment Company, Cleveland. The unit is intended for rural service or small industrial substations. The switch is built with monel ball bearings that do not require any lubrication. The bearing spindle which carries the operating insulator is a machined steel forging. Only three insulators, as shown in the illustration, are used to carry the switch, choke coil and fuse. Six standard types of mounting are provided. The switches are available for voltages from 10,000 to 40,000.

*Rural service switch combined with protective unit*

## Air Filters

An air filter which can be inserted in air pipe lines and which it is claimed will remove dust, water, oil, rust, scale and other foreign matter from air passing through the pipes has been placed on the market by the Staynew Filter Corporation, Rochester, N. Y. The filter consists of an aluminum housing inclosed in a pressed steel housing, which the manufacturers claim will withstand a working pressure of 125 lb. The filter mounted inside consists of a felt filter medium formed in pockets over radial wire screen fins grouped around a central outlet.. This permits mounting a relatively large area of felt in a compact space. The large capacity inserts are designed to pass 250 cu.ft. of free air per minute and contain 20 sq.ft. of felt within a volume slightly smaller than a cubic foot. Cleaning is accomplished by reversing the air flow.

Another type of filter used in filtering large volumes of air is of similar construction mounted in heavy pressed-steel frames. The filter can be cleaned by a special air suction cleaner. The manufacturers claim that it can be operated under ordinary conditions for several months before cleaning is necessary.

## Electrolysis Drainage Valve

The "Kuprox" electrolysis drainage valve for safeguarding against reverse currents, which cause electrolysis and chemical decomposition of underground metallic structures, has been developed by the Kodel Electric & Manufacturing Company, Cincinnati, Ohio. These drainage valves have no contacts or moving parts, are said to require no attention and will function indefinitely. Arranged for either pole or manhole installation and built in capacities up to 1,000 amp., the Kuprox (copper oxide) valve is said to be adaptable to any and all conditions where vagabond electric currents from grounded electrical distributing systems are causing decomposition of underground cables.

## Potential Transformer Fuse and Wire Wound Resistor

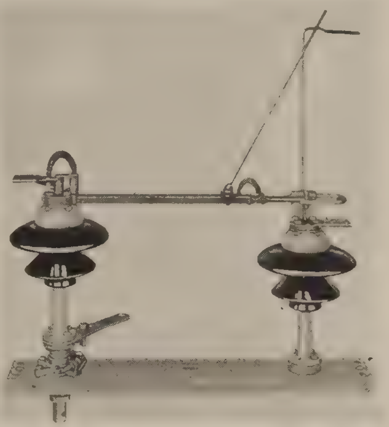
The type H combination potential transformer fuse and wire wound resistor for 2,500 to 25,000-volt service has been placed on the market by the Westinghouse Electric & Manufacturing Company. It is intended for indoor application and can be mounted on any flat surface or upon 1¼-in. pipe. The resistors are placed in series with the fuses and are said to limit effectively the current in case of short circuit. This permits the use of potential transformer fuses on any circuit regardless of its short-circuit amperes, provided the voltage rating of the system is not more than that of the fuses and resistors.

The resistors are made up of coiled nichrome wire wound in the grooves of a heavy wet-process porcelain tube. They are combined with fuse, fuse mountings and insulators. The resistor may be mounted either in line with or perpendicular to the insulators.

PRIMARY-RESISTANCE DRUM SWITCHES.—A new line of primary resistance drum switches for use with squirrel-cage induction motors on small cranes, hoists, machine tools, etc., has been announced by the General Electric Company. It is a primary reversing switch designed for wall mounting and can be furnished with a standard conduit box. It is made in two forms, CR-3200-1250-B, for hoists where the motor is overhauled in the lowering direction, and CR-3200-1250-A, for hoists where the motor is not overhauled in the lowering direction. The switches are built without operating mechanism so that the user may select the type of operating equipment he desires. The switches are designed for operation on maximum primary voltages of 550 and the maximum horsepower rating for two- or three-phase service is 15.

## Two-Insulator "Hi-Pressure" Contact Switch

A complete line of type "A" switches, as shown in the illustration, has been developed by the Railway & Industrial Engineering Company, Greensburg, Pa., up to 154 kv. The blade revolves on a rotor bearing, and in closing the toggle end strikes the stop and straightens out, sliding the contact surfaces into closed position. The final sliding movement takes place under high pressure, which the manufacturer claims removes all dirt, ice and corrosion. They are built for either air-break or disconnecting purposes.



*"Hi-Pressure" contact switch of the two-insulator type*

## Gasoline-Engine-Driven Welding Outfit

A 300-amp. gasoline - engine - driven welder, known as Model S-1964, has been placed on the market by the Lincoln Electric Company, Cleveland. The welding generator is rated at 300 amp. in accordance with N.E.M.A. standards and has a current range of from 75 to 400 amp. for metallic electrode welding. It is direct connected to a six-cylinder Buda Model HS-6 engine, operating at 1,500 r.p.m. Both units are mounted on a welded steel base. The generator has a laminated magnetic circuit with separately excited field, stabilizer, variable voltage and steel construction features of the company's line of "Stable-Arc" welders. The over-all dimensions are 93 in. long, 35 in. wide with an over-all height of 45 in. The equipment has been designed to meet the constantly increasing use of larger electrodes in welding, and the six-cylinder performance gives a smooth, even flow of power, so necessary for successful welding.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued June 5, 1928)

1,672,302. Siren-Control System; H. S. Campbell, Hammond, Ind. App. filed Dec. 22, 1922.

1,672,312. Electrical Fixture Unit; S. N. Griffith, Doylestown, Pa. App. filed Aug. 21, 1923.

1,672,314. Friction Brake; J. H. Hall, Cleveland Heighs, Ohio. App. filed Oct. 5, 1925. Of the spring-applied and electromagnetically-released type.

1,672,324. Wire-Threading Leader and Coupler; C. H. Kepler, Oakland, Calif. App. filed Oct. 23, 1925. To facilitate the passing of wires through conduits.

1,672,357. Joint for Electric Cables; J. F. Watson, Abbey Wood, England. App. filed Oct. 29, 1927.

1,672,365. Electric Switch; G. A. Burnham, Saugus, Mass. App. filed July 25, 1921. Oil immersed.

1,672,402. Plating Apparatus and Product Thereof; E. R. Armstrong, Hollyoak, Del. App. filed Oct. 14, 1924.

1,672,410. Method for Testing Railway-Traffic-Controlling Apparatus; L. O. Grondahl, Pittsburgh, and P. H. Geiger, Wilkinsburg, Pa. App. filed Jan 18, 1926.

1,672,476. Protecting Apparatus for Linemen; M. T. Tipsord and H. W. Bodendieck, Taylorville, Ill. App. filed Jan. 30, 1926.

1,672,494. Switch-Operating Mechanism; A. F. C. Lotz, Chicago, Ill. App. filed June 1, 1925. Mechanism for closing an oil switch and for tripping the same open.

1,672,509. Reel for Electric Irons; B. F. P. Vedder, Milwaukee, Wis. App. filed Nov. 11, 1926.

1,672,521. Electric Plug Connecter; A. R. Goldrick, Cleveland, Ohio. App. filed Dec. 1, 1921.

1,672,556. Two-Light Plug; T. A. Both, Stratford, Conn. App. filed June 13, 1924.

1,672,592. Sterilizing Apparatus; D. G. Will, Fort Wayne, Ind. App. filed Nov. 17, 1924.

1,672,620. Combination Fuse and Plug; W. B. Moss, Jr., and M. L. Ardisana, Evanston, Ill. App. filed June 14, 1926.

1,672,664. Twin-Light Plug; O. H. Van Amburg, Bridgeport, Conn. App. filed Nov. 21, 1922.

1,672,667. Electric Furnace; H. L. Watson, Lynn, Mass. App. filed Nov. 13, 1926. High temperature.

1,672,669. Constant Current Transformer; T. G. Whyte, Lynn, Mass. App. filed Aug. 13, 1925. Of the movable coil type.

1,672,670. Electric Motor-Control System and Apparatus; M. Wilfart, Paris, France. App. filed July 17, 1924. For use in operating machines having widely varying load characteristics such as rolling mills and the like.

1,672,674. Regulating System; R. M. Carothers, Schenectady, N. Y. App. filed June 24, 1926. Voltage regulating.

1,672,680. Dynamo-Electric Machine; E. H. Freiburghouse, Schenectady, N. Y. App. filed April 21, 1925. Ventilating system.

1,672,683. Outlet or Junction Box; H. G. Knoderer, Englewood, N. J. App. filed June 4, 1921.

1,672,685. Commutator; G. Lewinnek, Berlin, Germany. App. filed Jan. 4, 1926. Double commutator.

1,672,690. Control System and Apparatus for Electrical Devices; C. C. Runner, Schenectady, N. Y. App. filed Aug. 6, 1924.

1,672,693. Expansion Joint; R. C. Scott, Cambridge, Mass. App. filed June 1, 1925. For buses employed in high voltage power or switching stations for the transmission of electrical energy.

1,672,702. Welding Apparatus; J. M. Weed, Schenectady, N. Y. App. filed Dec. 11, 1923.

1,672,703. Induction Voltage Regulator; H. R. West, Pittsfield, Mass. App. filed Sept. 23, 1927.

1,672,706. Method of Making Contact Tips; W. W. Brown, Erie, Pa. App. filed Jan. 13, 1926. Of drum controllers or other switch mechanism.

1,672,714. Nonaqueous Electrolytic Condenser; E. W. Engle, Lake Forest, Ill. App. filed Aug. 29, 1927.

1,672,724. Electric Oven; F. H. McCormick, Glen Ellyn, Ill. App. filed Oct. 18, 1926.

1,672,725. Electric Heater; F. H. McCormick, Glen Ellyn, Ill. App. filed Oct. 1, 1927.

1,672,727. Electric Switch; A. H. Nero, West Hartford, Conn. App. filed Feb. 15, 1926.

1,672,729. Magnetic Cut-Out Plug; C. Pape, Berlin, Germany. App. filed Nov. 5, 1925.

1,672,777. Regulating Apparatus; D. C. Prince, Schenectady, N. Y. App. filed March 13, 1926. For the transmission of current between alternating and direct current circuits.

1,672,791. Electrical Switch; W. S. Thimblethorpe, London, England. App. filed Aug. 21, 1926. Two-way delayed action switch useful in signaling work and apparatus.

1,672,800. Electric Cut-Out for Stills and the Like; L. F. Boss, Woods Hole, Mass. App. filed May 12, 1926.

1,672,802. Device for Resetting Power-Driven Mechanism to a Predetermined Position; M. Chirol, Bourg-La-Reine, France. App. filed Nov. 19, 1926.

1,672,809. Electric Iron and Stand; W. P. Haynie, Philadelphia, Pa. App. filed Oct. 5, 1925.

1,672,821. Submarine Cable Core and Insulation Therefor; C. Martell, Cicero, Ill. App. filed Oct. 7, 1924.

1,672,847. Electrical Power System; J. J. Kane, Milwaukee, Wis. App. filed April 19, 1921. Device for regulating generators driven by prime-movers, to supply variable loads, especially where there is a tendency for the generator-driving means to operate at a speed dependent upon the load.

1,672,859. Intermittent-Current Device; J. W. Phelps, Chicago, Ill. App. filed March 11, 1925. Make and break or flashing device.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Johannesburg, South Africa (No. 31,758), for batteries for radio and flashlights, household electric equipment and cable insulated wire.

Purchase and agencv are desired in Calcutta, India (No. 31,764), for electric fans, incandescent lamps, sockets, switches, etc., and small motors.

An agency is desired in Port Elizabeth, South Africa (No. 31,761), for flashlights and cable insulated wire.

An agency is desired in The Hague, Netherlands (No. 31,760), for household electric equipment.

An agency is desired in Barbados, West Indies (No. 31,754), for small hydro-electric generator sets.

Purchase is desired in São Paulo, Brazil (No. 31,757), of electric motors and small steel furnaces.

Purchase is desired in Sydney, Australia (No. 31,755), of fractional horsepower motors.

An agency is desired in London, England (No. 31,811), for portable electric bakers' and confectioners' ovens.

Purchase and agency are desired in Oslo, Norway (No. 31,762), for sewing machine motors, electric vacuum cleaners, washing machines and wringers.

Purchase is desired in Huddersfield, England (No. 31,759), and in Halifax, England (No. 31,763), of traffic-control devices.

Purchase is desired in Hamburg, Germany (No. 31,756), of electric welding machines.

An agency is desired in Algiers, Algeria (No. 31,753), for X-rays and ultra-violet rays apparatus.

Copies of a tender for the supply of transformers and switchgear for a new pre-cooling plant which is now being erected in Durban by the South African Railways and Harbors have been received (EE 1076). The closing date is July 12, 1928.

The Porto Rico Railway, Light & Power Company, San Juan, will begin work on the Rio Blanco power project, to cost $800,000. J. R. McKey, San Juan, P. R., Assistant Trade Commissioner.

An agency is desired by Remy Armbruster Jun., Basel 1, Switzerland, for motors and industrial heating equipment.

# New Trade Literature

APPARATUS FOR BURNING PULVERIZED FUEL.—Catalog U-3 describing the "Lopulco" unit system for burning pulverized fuel by the direct-fired method has been issued by the Combustion Engineering Corporation, 200 Madison Avenue, New York City. The construction and operation of the mills used in the system are described and illustrated. Line diagrams of the applications of the "Lopulco" unit system to various types and sizes of boilers are included. It also contains illustrations covering the various types of horizontal, vertical and tangential burners used with the system.

RELAY AND TEST BLOCKS.—The General Electric Company, Schenectady, N. Y., has issued bulletins GEA-943 and GEA-949 covering respectively polyphase induction power-directional relays and temperature overload relay panels for use with hand compensators. The company also is distributing bulletin GEA-900, which describes and illustrates its type PK-1 test blocks and plugs for switchboard-mounted meters, instruments and relays.

AIR COMPRESSOR.—Bulletin No. 140 issued by the Pennsylvania Pump & Compressor Company, Easton, Pa., describes its multiple-belt-driven semi-portable air compressor unit arranged for automatic start and stop control.

ALLOY STEEL. — The International Nickel Company, Inc., 67 Wall Street, New York City, is distributing bulletin No. 12, which contains information on the use of alloy steel for boiler construction.

MOTOR DRIVES FOR WOOLEN CARDS AND MOTORS.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-967 covering its types FTR and FQR squirrel-cage and types MT and MQ wound-rotor motor drives for woolen cards. The company is also distributing bulletin GEA-166A describing its alternating-current, open or inclosed crane and hoist motors.

OIL PURIFIER.—The De Laval Separator Company, 165 Broadway, New York City, has issued a bulletin which covers the new No. 700 portable De Laval insulating oil purifier. It contains information on the construction of the oil purifier and shows how it is used.

REFRIGERATORS.—"Modern Refrigeration in the Modern Color Setting" is the title of a booklet issued by the Servel Sales, Inc., 51 East 42d Street, New York City. It discusses in detail the modern color idea, particularly as applied to the kitchen.

GENERATING AND OIL-TESTING SETS. — The General Electric Company, Schenectady, N. Y., is distributing bulletin GEA-781A describing and illustrating the steam-engine-driven generating sets for marine service. The company also has issued bulletin GEA-832 covering its portable oil-testing sets.

CONDUIT ACCESSORIES.—The Cleveland Wrought Products Company, West 58th Street and Denison Avenue, Cleveland, is distributing a circular covering its electrical conduit accessories, including lock nuts, pipe clamps and conduit bushings.

CHAIN DRIVE, POWER TRANSMISSION EQUIPMENT, ETC.—The Link-Belt Company, 910 South Michigan Avenue, Chicago, has issued a catalog and engineering data book, No. 500, which covers the complete chain, sprocket, power transmission, elevating and conveying and engineering divisions of the company's business and contains information of practical use to the engineer. Complete price lists also are included.

OUTDOOR STATION EQUIPMENT, SWITCHES AND ELECTRIC FURNACES. —Bulletins GEA-782, GEA-403A, GEA-939, GEA-979 and GEA-972 issued by the General Electric Company, Schenectady, N. Y., describe and illustrate respectively its weatherproof switch houses with manually operated oil circuit breakers for outdoor station equipment, the CR-900 reversing and non-reversing drum-type switches, disconnecting switches for indoor service, the CR2960-SY104A and SY103A control circuit switches and the GE pot-type electric furnaces for cyanide hardening.

STARTER. — The Allen - Bradley Company, Milwaukee, has issued bulletin No. 648 covering its resisto-transformer starter, a new starter for squirrel-cage motors. The bulletin contains illustrations, wiring diagrams and a complete description of the starter.
